

The what, how, why of SDMs/ENMs

Bob Muscarella

Sapienza University, Roma

June 9-11

THE NICHE-RELATIONSHIPS OF THE CALIFORNIA THRASHER.¹

BY JOSEPH GRINNELL.

THE California Thrasher (*Toxostoma redivivum*) is one of the several distinct bird types which characterize the so-called "Californian Fauna." Its range is notably restricted, even more so than that of the Wren-Tit. Only at the south does the California

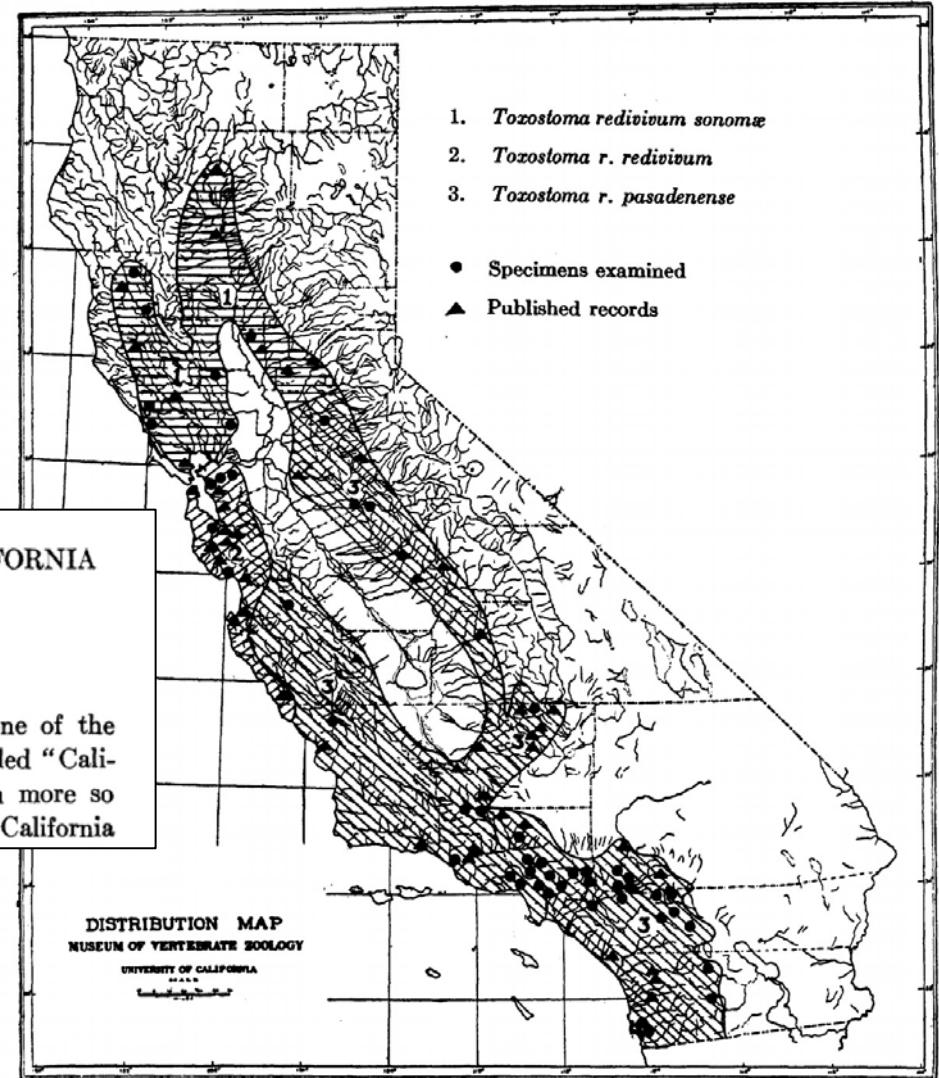

Figure 1.

The what, how, why of SDMs/ENMs

What:

- Models that describe the distribution of species across space or environmental gradients

How:

- Develop statistical relationships between environmental conditions and locations where a species is present (and, in some cases, absent)

Why:

- Address fundamental questions of ecology / evolution
- Understand the potential exposure of species to environmental change
- Develop solutions for applied problems in conservation, restoration, agriculture, forestry, etc.

The what, how, why of SDMs/ENMs

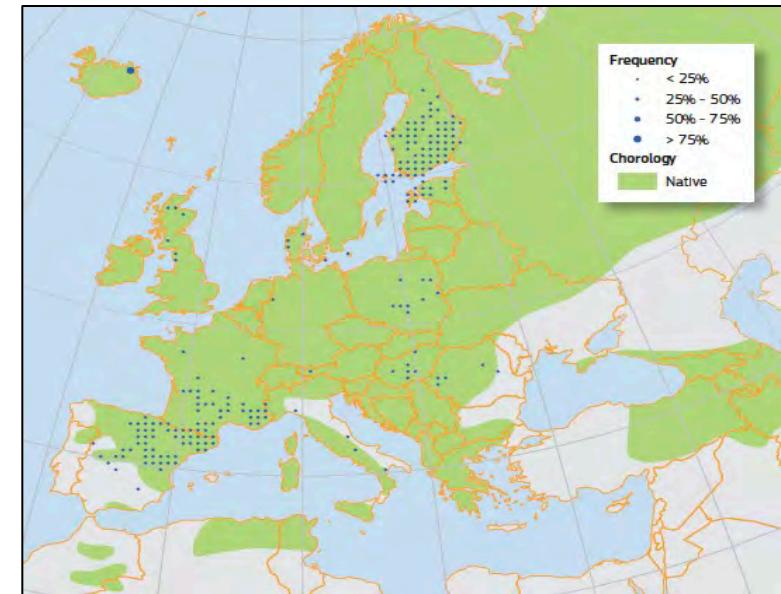

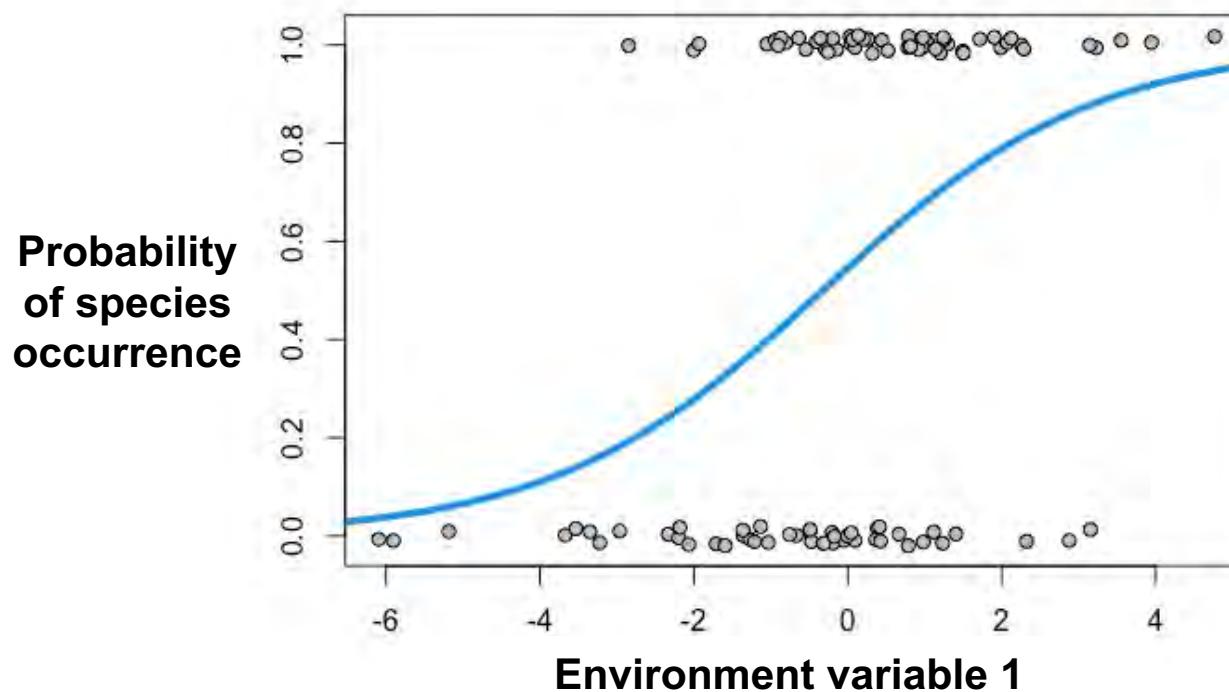

What:

- Models that describe the distribution of species across space or environmental gradients

The what, how, why of SDMs/ENMs

What:

- Models that describe the distribution of species across space or environmental gradients
 - ENMs* (Ecological or Environmental niche models) focus on environmental space
 - SDMs* (Species distribution models) focus on geographic space

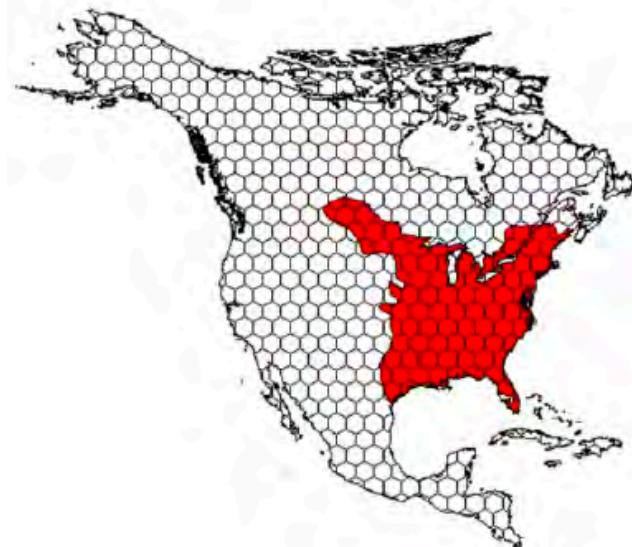

The what, how, why of SDMs/ENMs

Who is where?

Occurrence records are biased / incomplete samples in terms of taxonomy, geography, and time

Taxonomic Coverage

Geographic Coverage

Understanding distributions is critical for conservation

NT

Black-and-gold Cotinga *Tijuca atra*

Justification

This species is classified as Near Threatened because it is suspected to be declining moderately rapidly owing to habitat loss.

Taxonomic source(s)

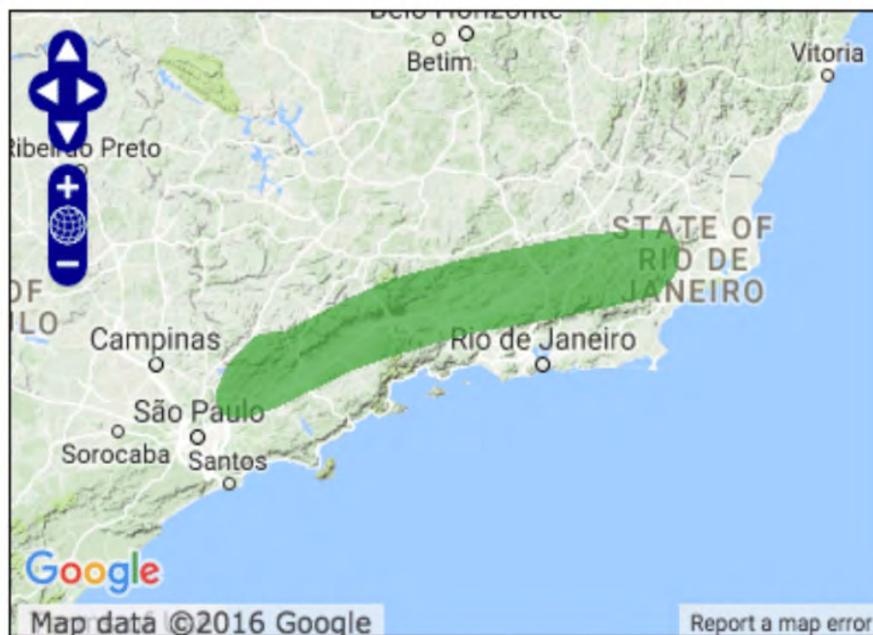

SACC. 2006. A classification of the bird species of South America. Available at:
<http://www.museum.lsu.edu/~Remsen/SACCBaseline.html#>.

Distribution and population

Tijuca atra occurs in Rio de Janeiro, extreme east São Paulo and adjacent south Minas Gerais, south-east Brazil (Ridgely and Tudor 1994, Parker et al. 1996). Despite this highly restricted range, habitat destruction of its montane Atlantic forest has been much less extensive than in adjacent lowland areas (Stattersfield et al. 1998). As a consequence, it is numerous in the upper reaches of Itatiaia and Serra dos Órgãos national parks, and locally fairly common in the canopy and middle levels of montane forest elsewhere within its range (Ridgely and Tudor 1994).

Population justification

The global population size has not been quantified, but this species is described as 'uncommon' (Stotz et al. 1996).

Challenges to understand distributions

- Observations are biased in taxonomy, space, and time
- Incomplete knowledge of species distributions
- Errors and uncertainties in available data
- Scale-dependency of all range mapping phenomena
- In reality, “species” and “distributions” are not homogeneous entities

jfd

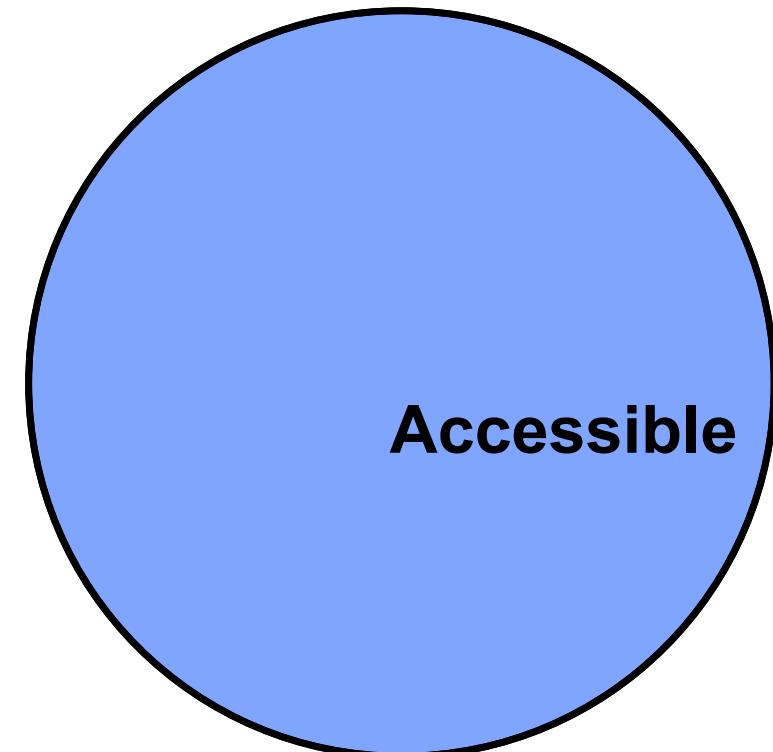

Who is where?
And why?

Absent

Present

Who is where? *And why?*

- Accessible (movement)
 - Short-term movement
 - Long-term dispersal
 - Geographic barriers

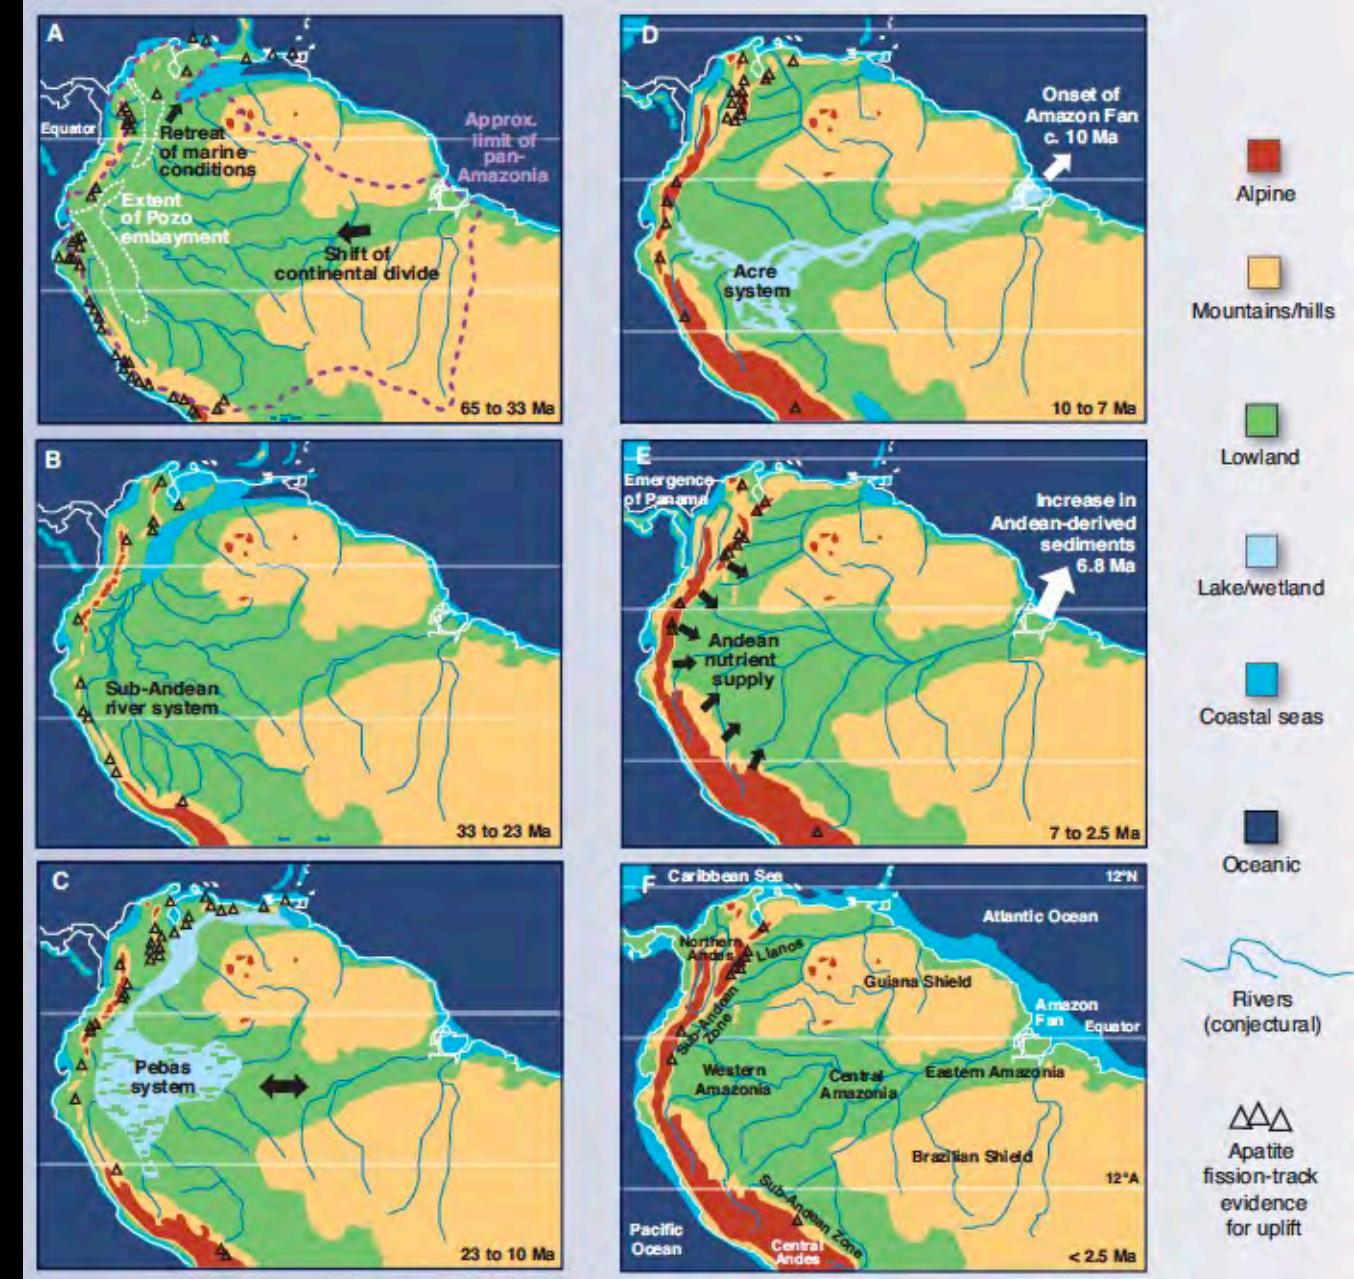

Organisms move

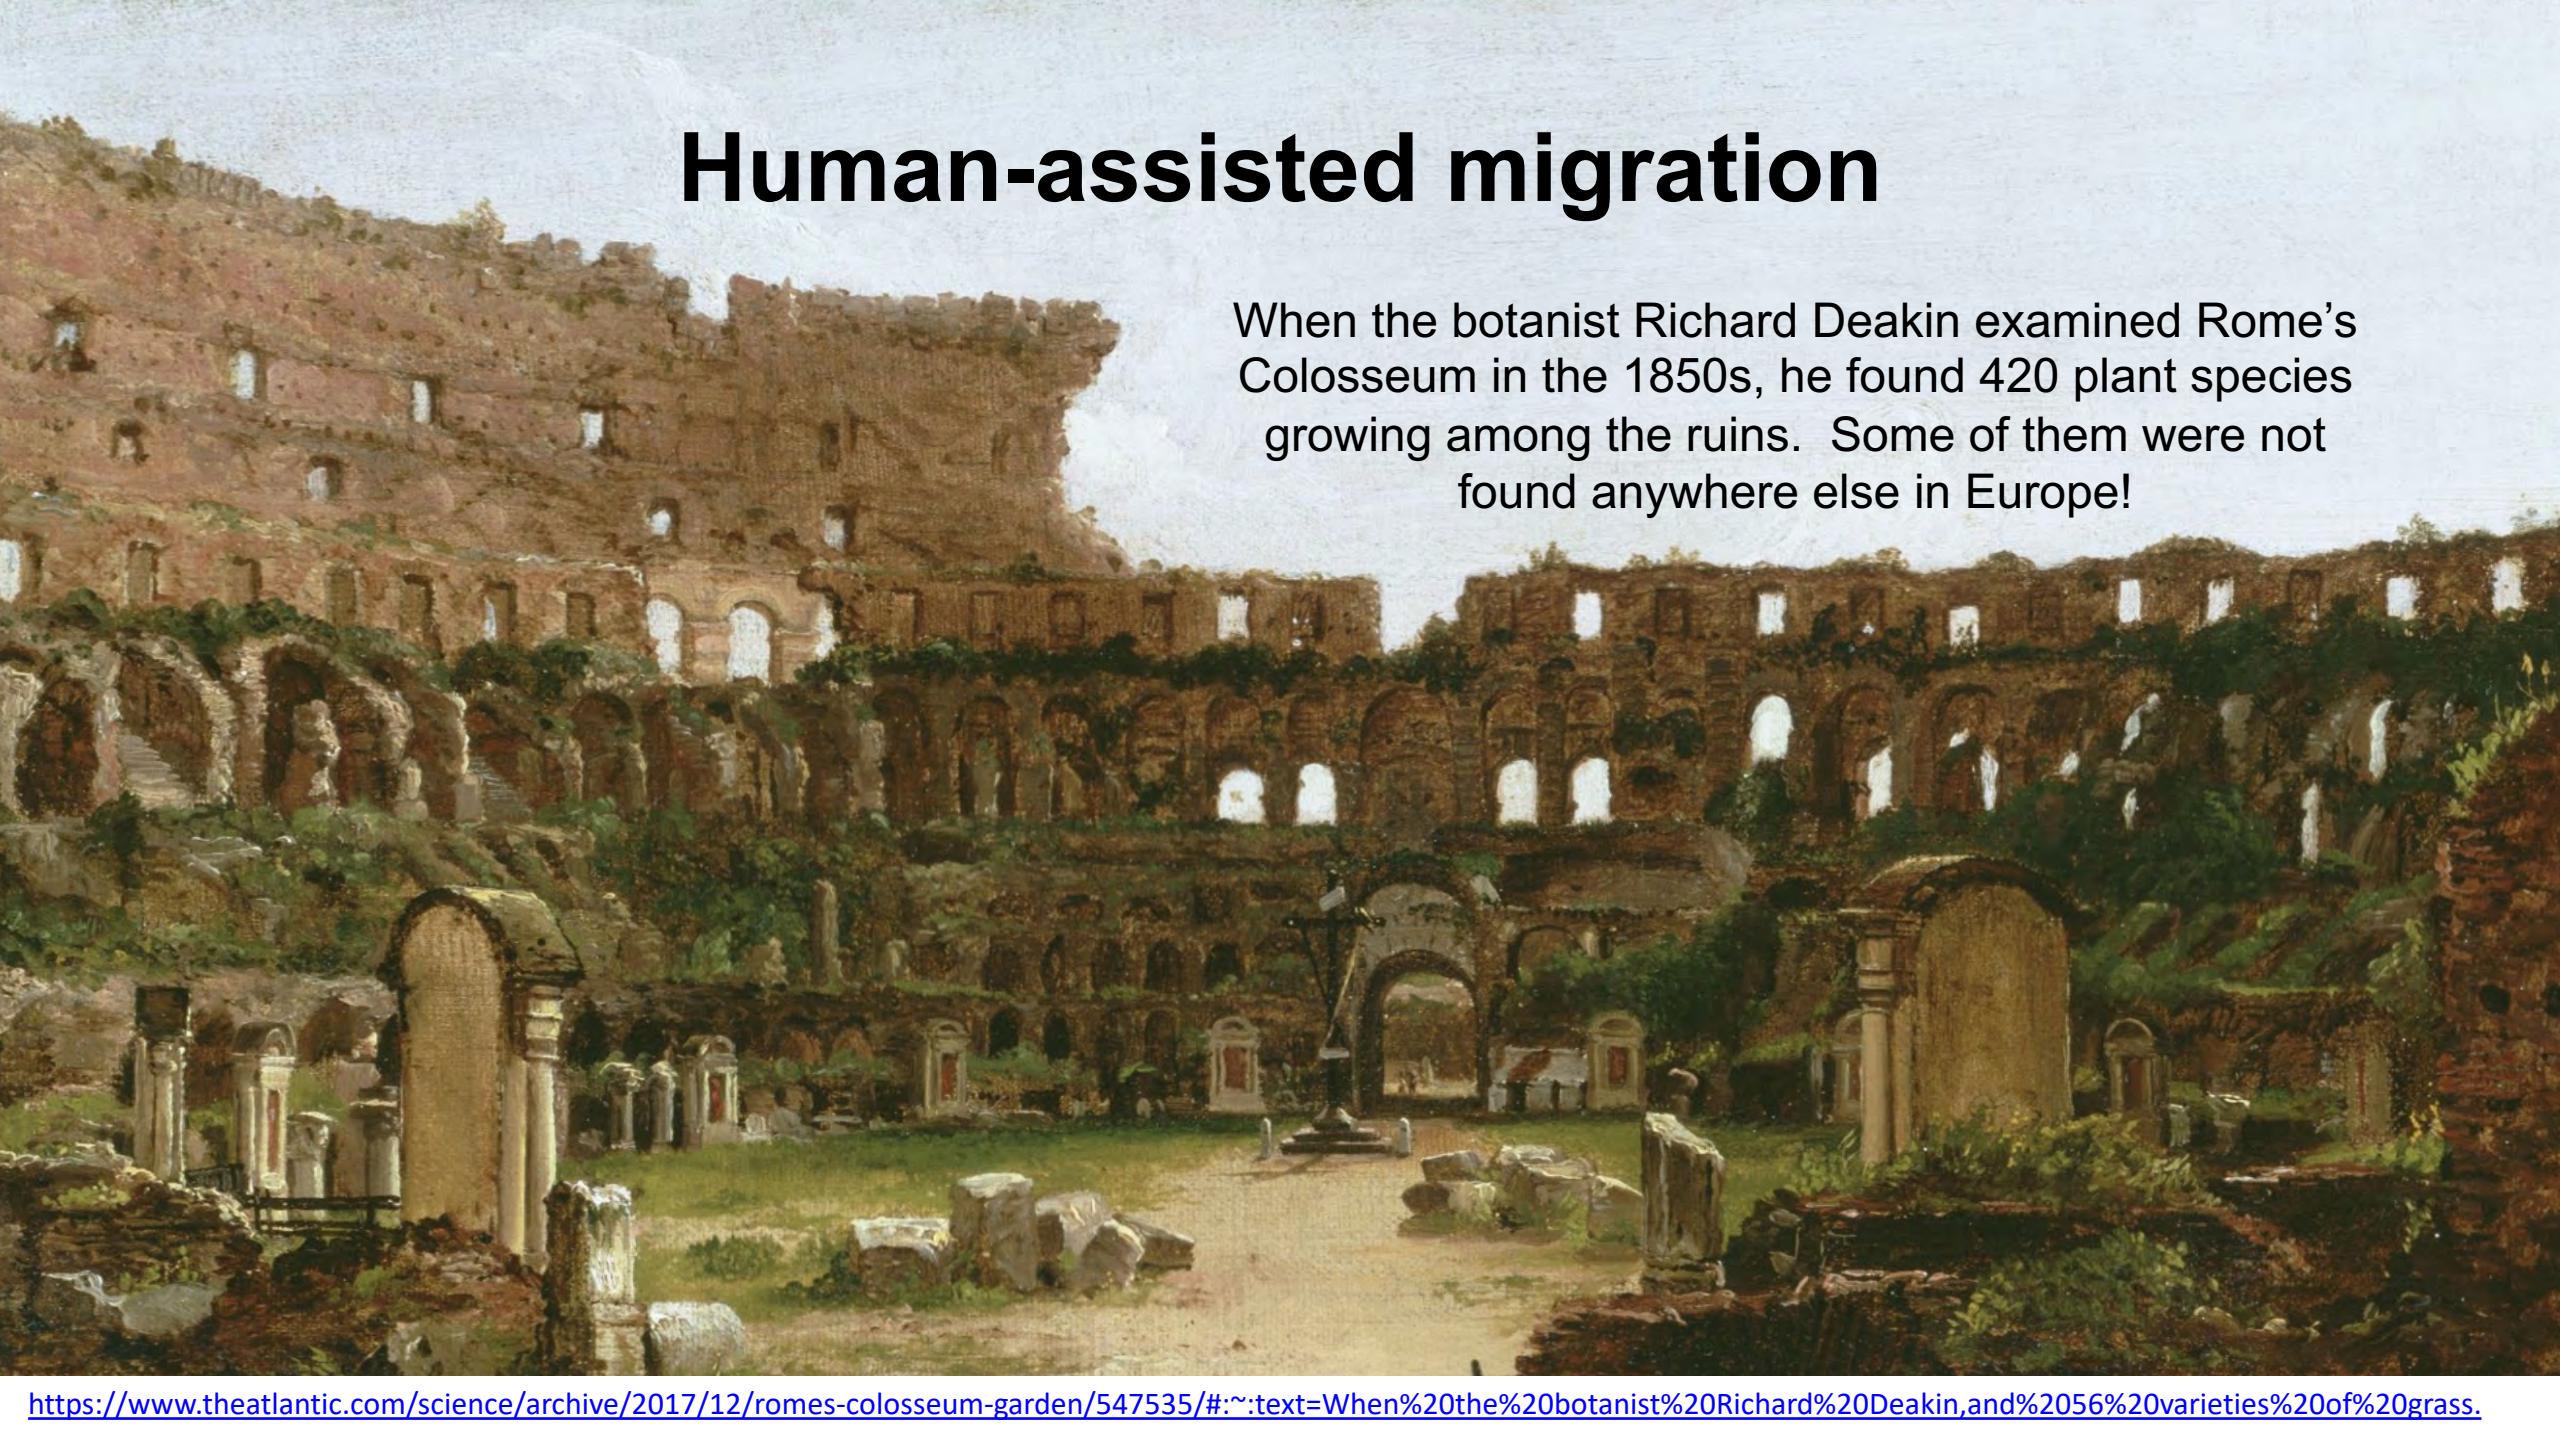

(in different ways and at different rates!)

Geology happens

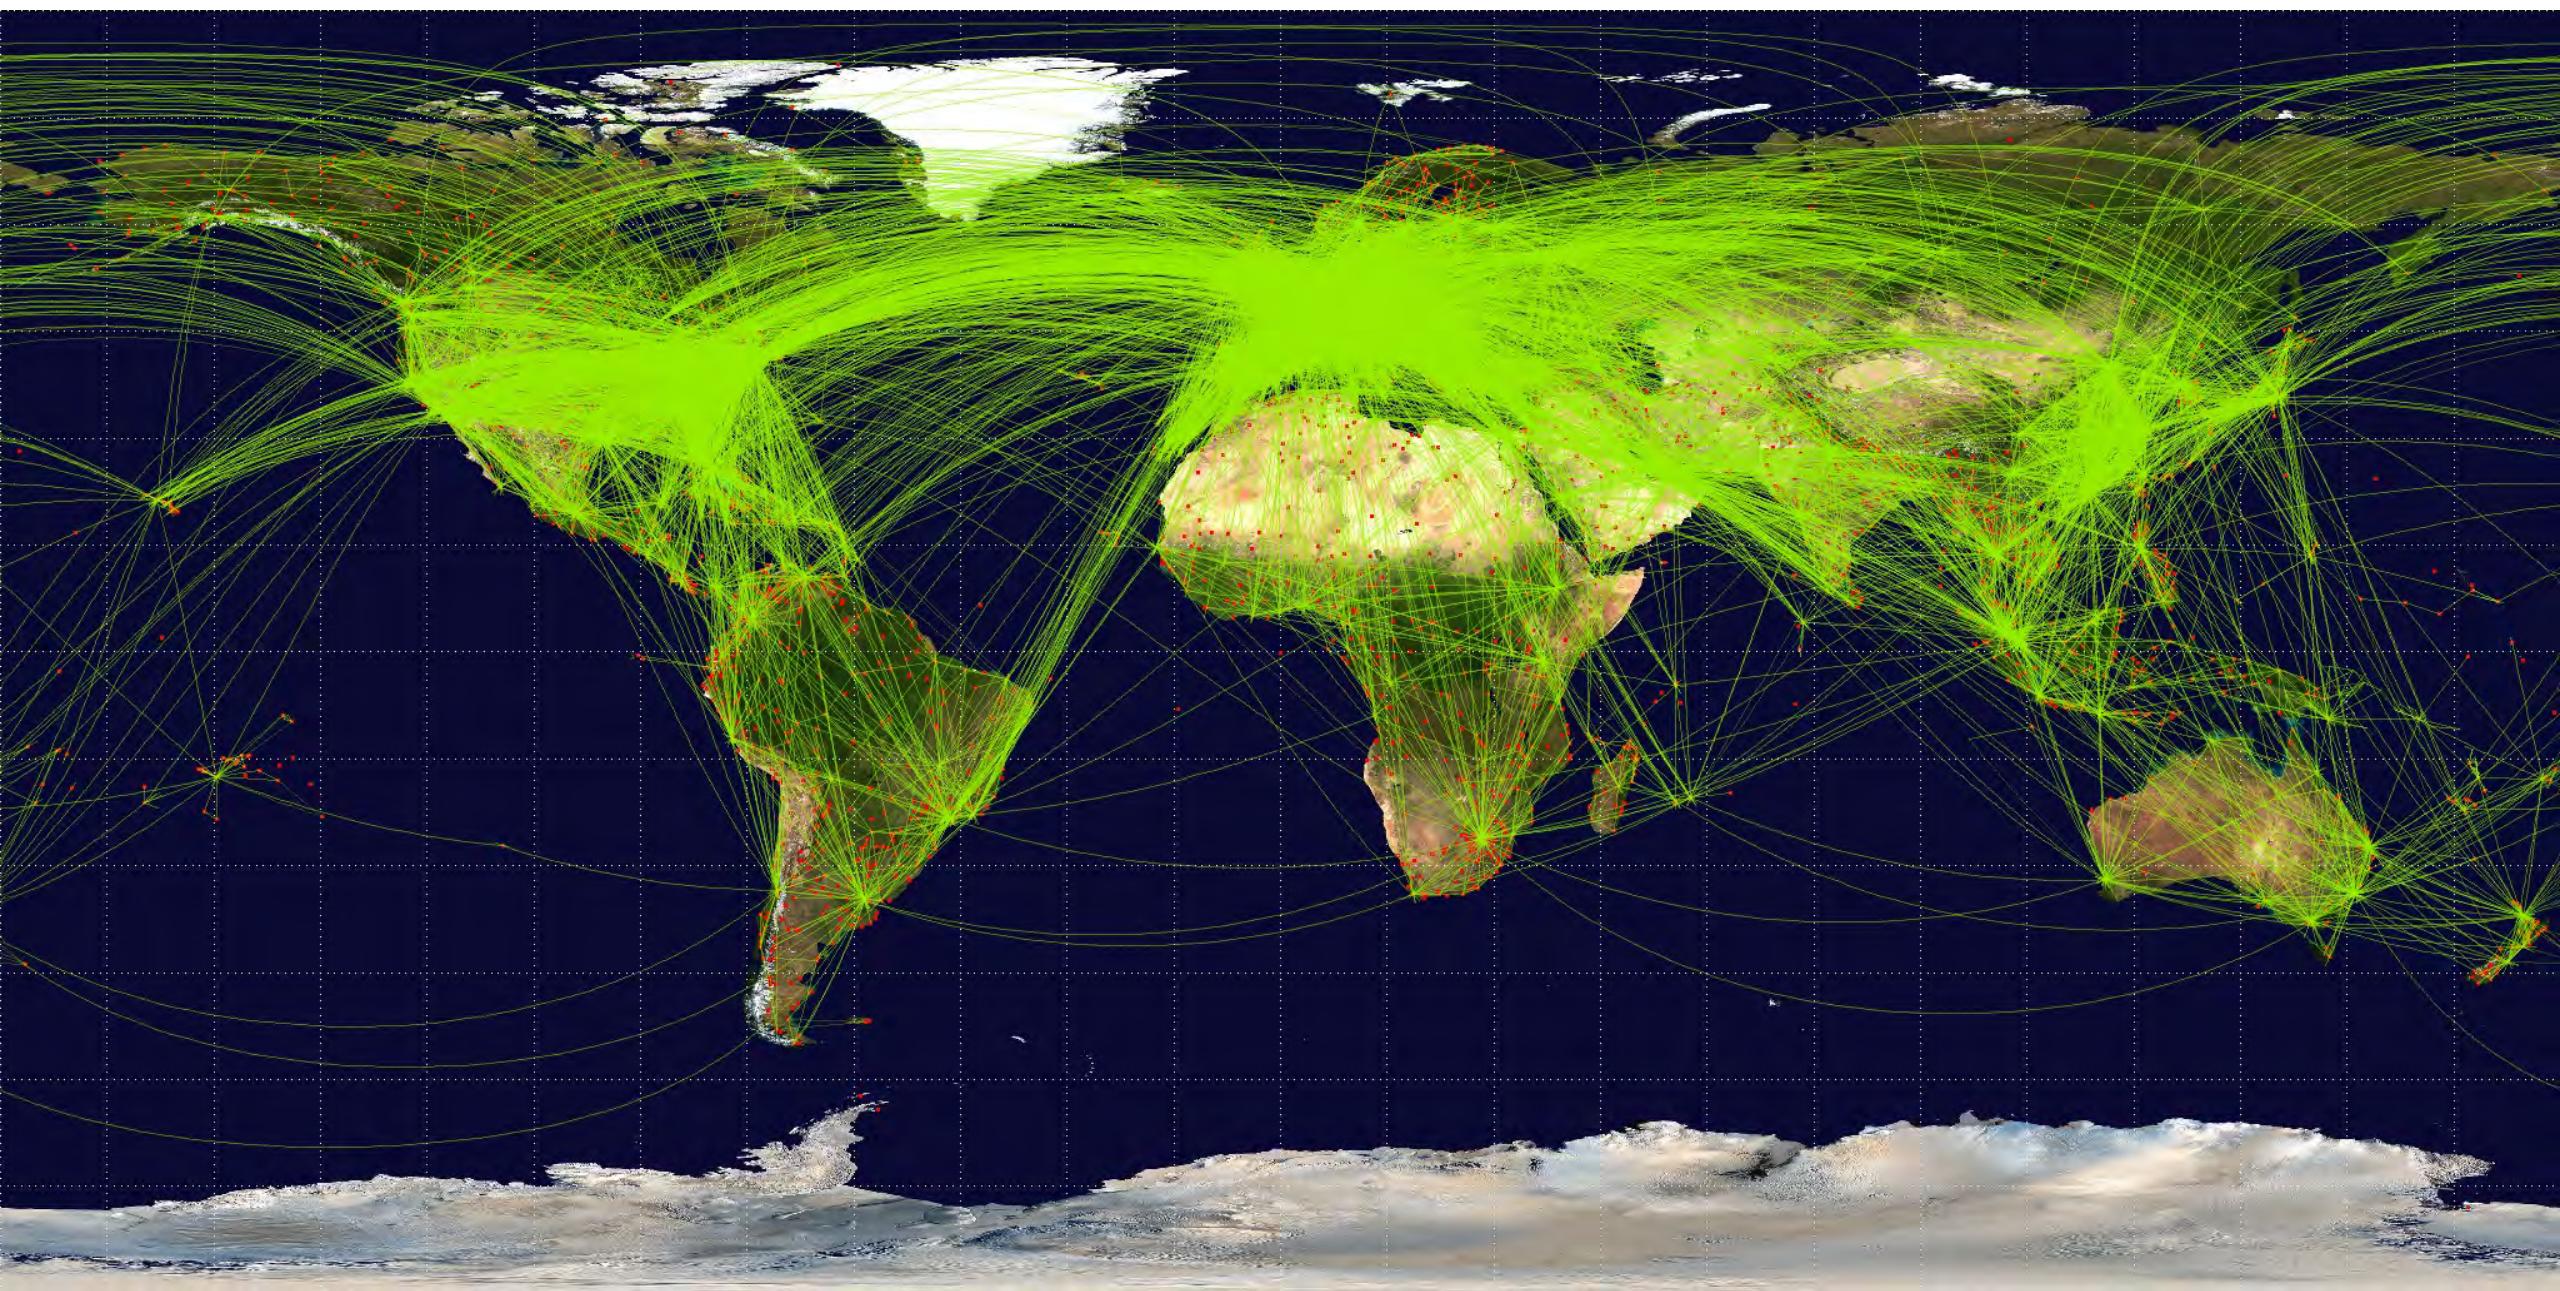

Hoorn et al. (2010) Amazonia Through Time: Andean Uplift, Climate Change, Landscape Evolution, and Biodiversity. *Science* 12: 927-931.

Human-assisted migration

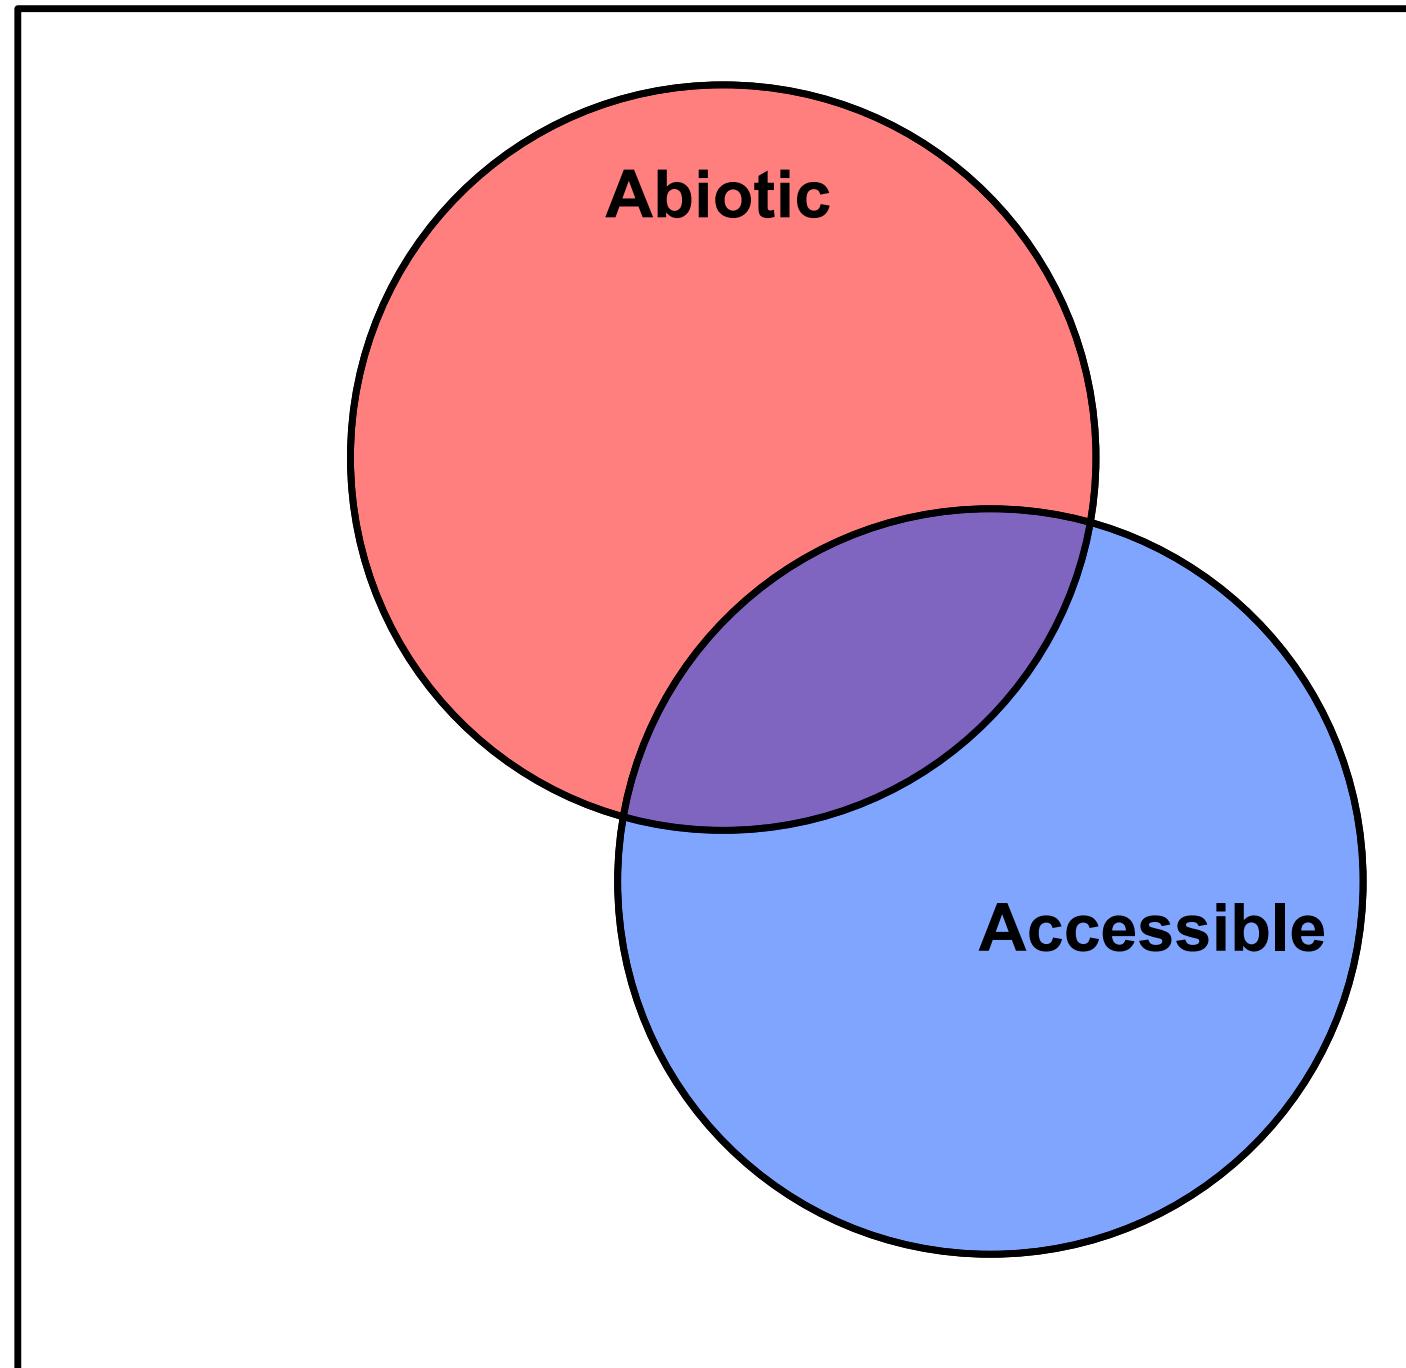

When the botanist Richard Deakin examined Rome's Colosseum in the 1850s, he found 420 plant species growing among the ruins. Some of them were not found anywhere else in Europe!

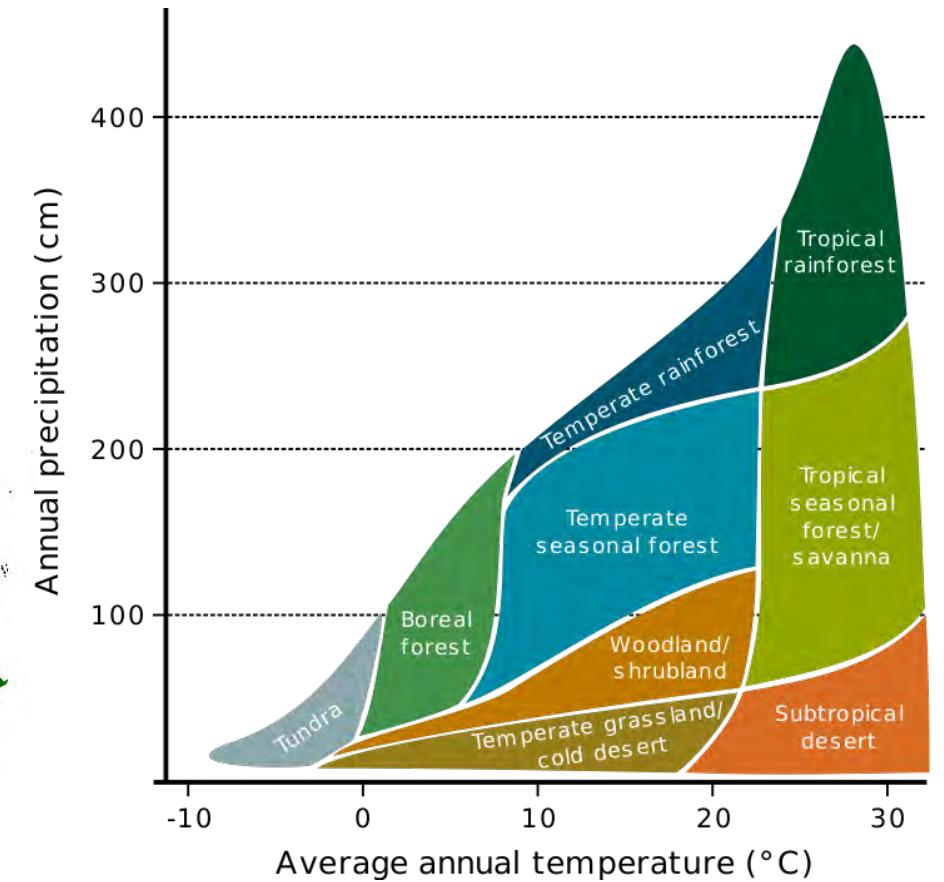

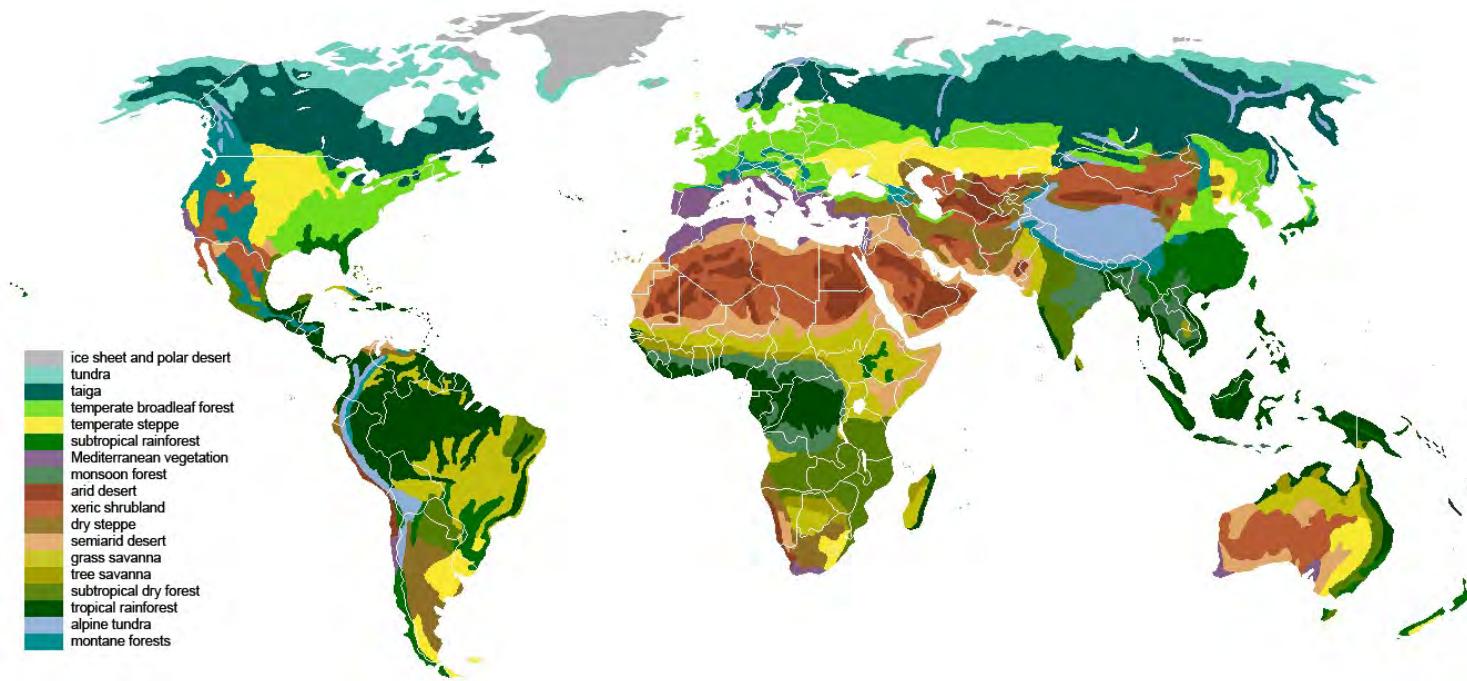

Who is where? *And why?*

- Accessible (movement)
- Physiological tolerance (abiotic)
 - Climate
 - Soil / water chemistry
 - Nutrients

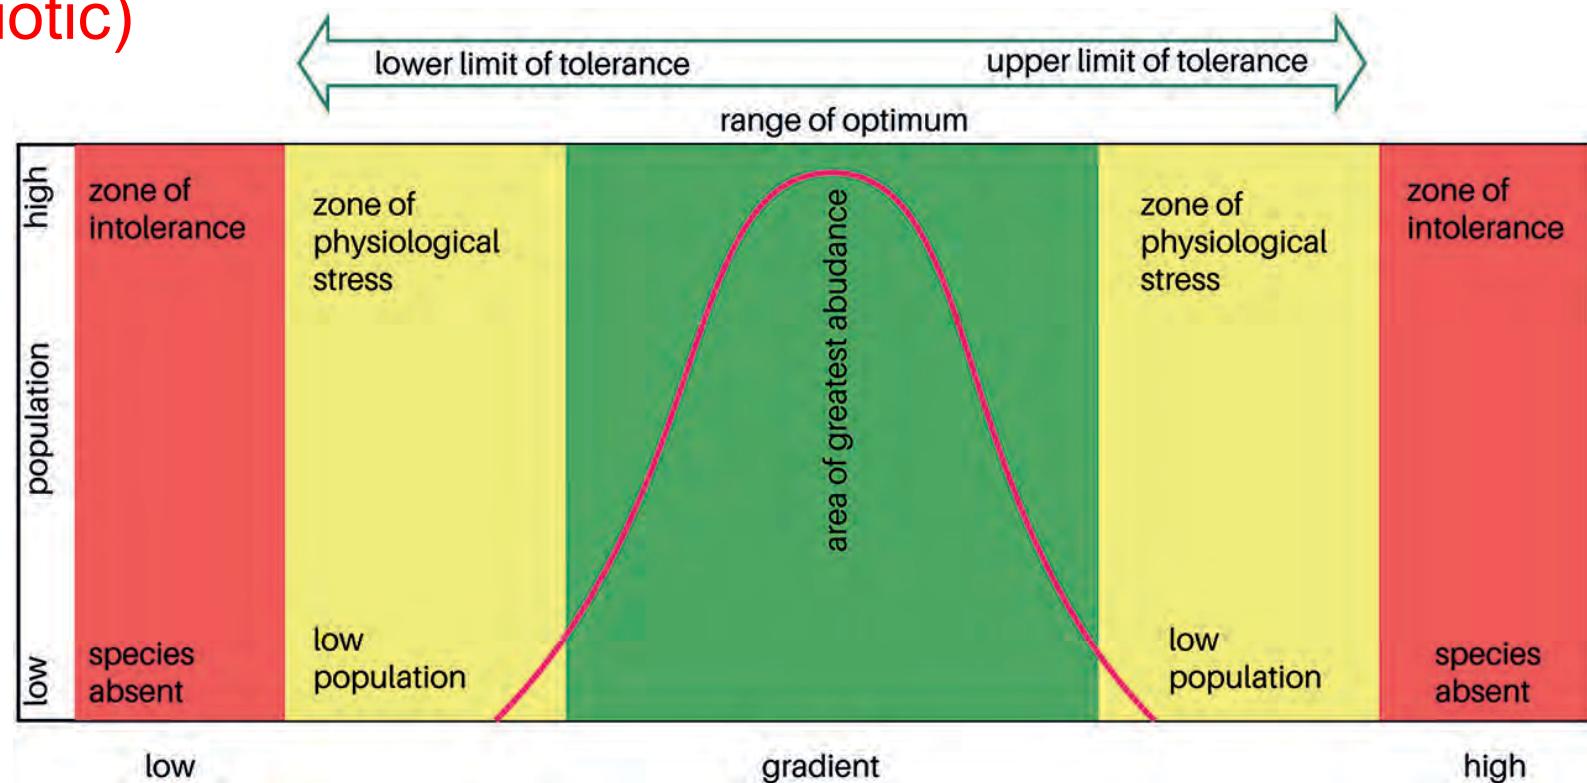

Biomes of Earth

Distributions of biomes are largely explained by mean annual rainfall and temperature

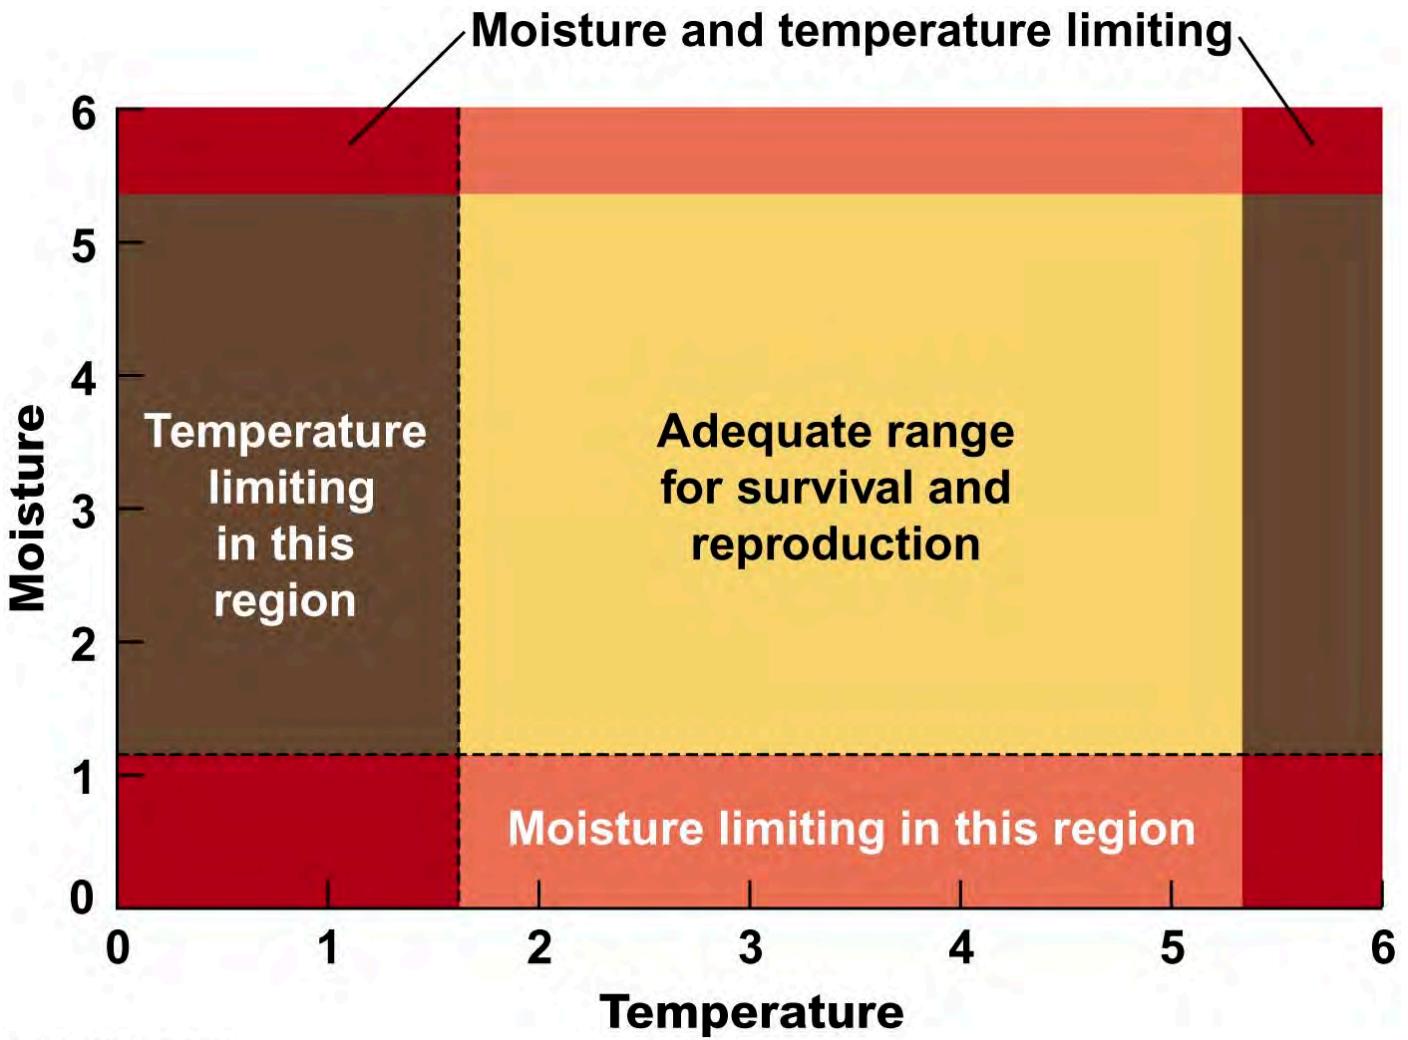

Who is where? *And why?*

- Accessible (movement)
- Physiological tolerance (abiotic)

Who is where? *And why?*

- Accessible (movement)
- Physiological tolerance (abiotic)

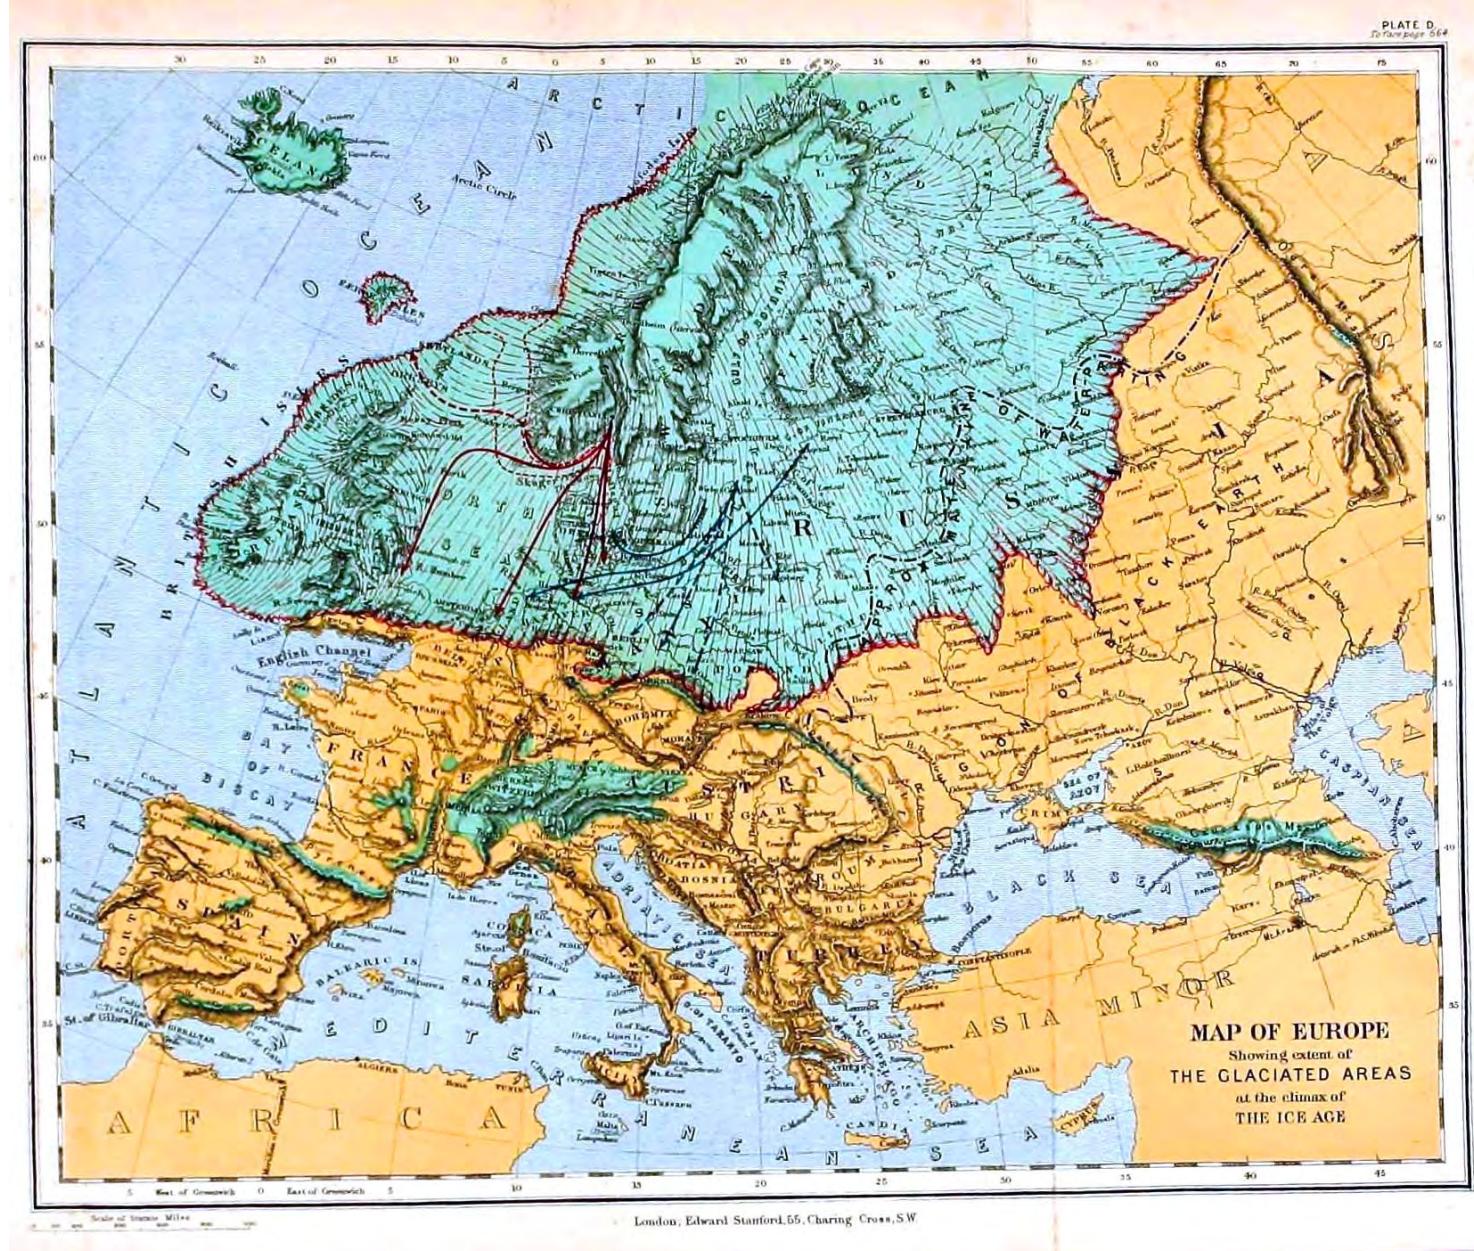

Who is where? And why?

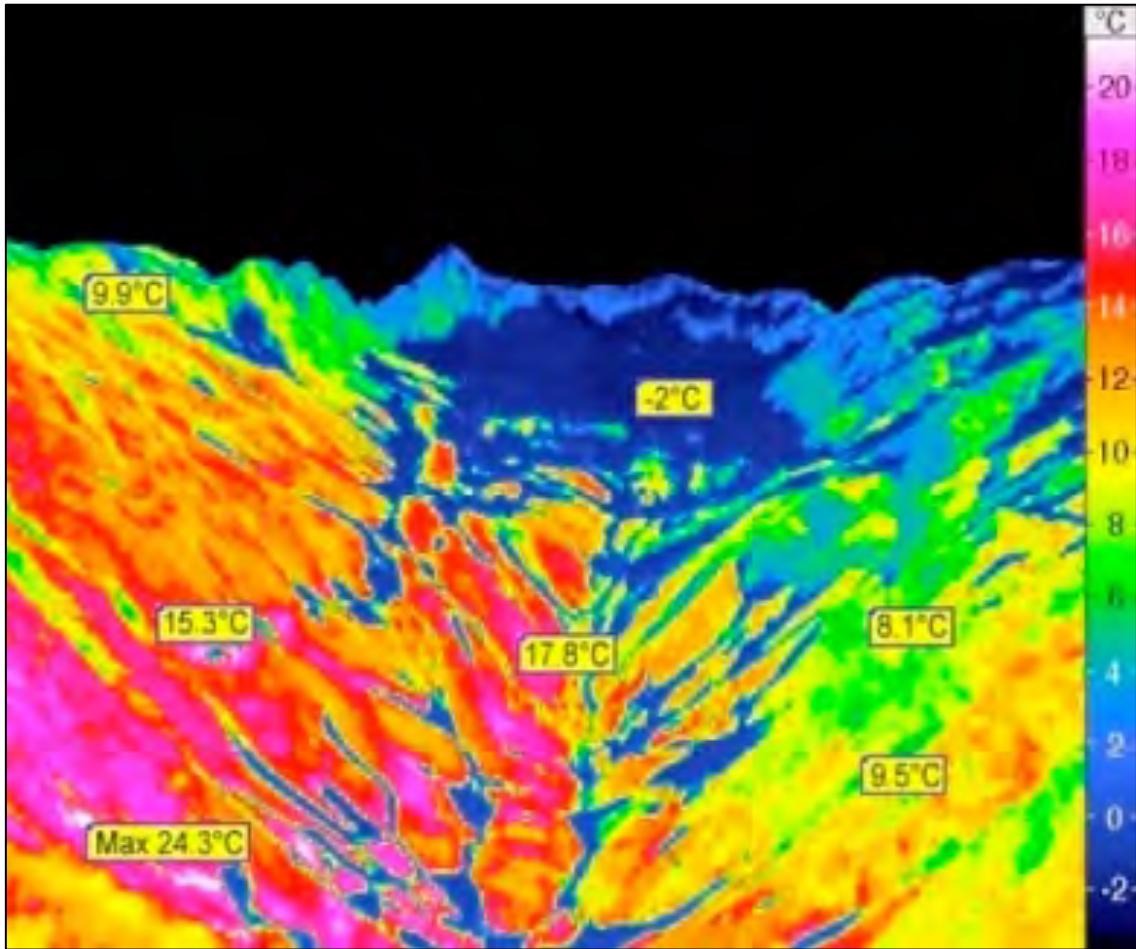

Megafauna in Spain during last glacial maximum

Europe during the last glacial maximum

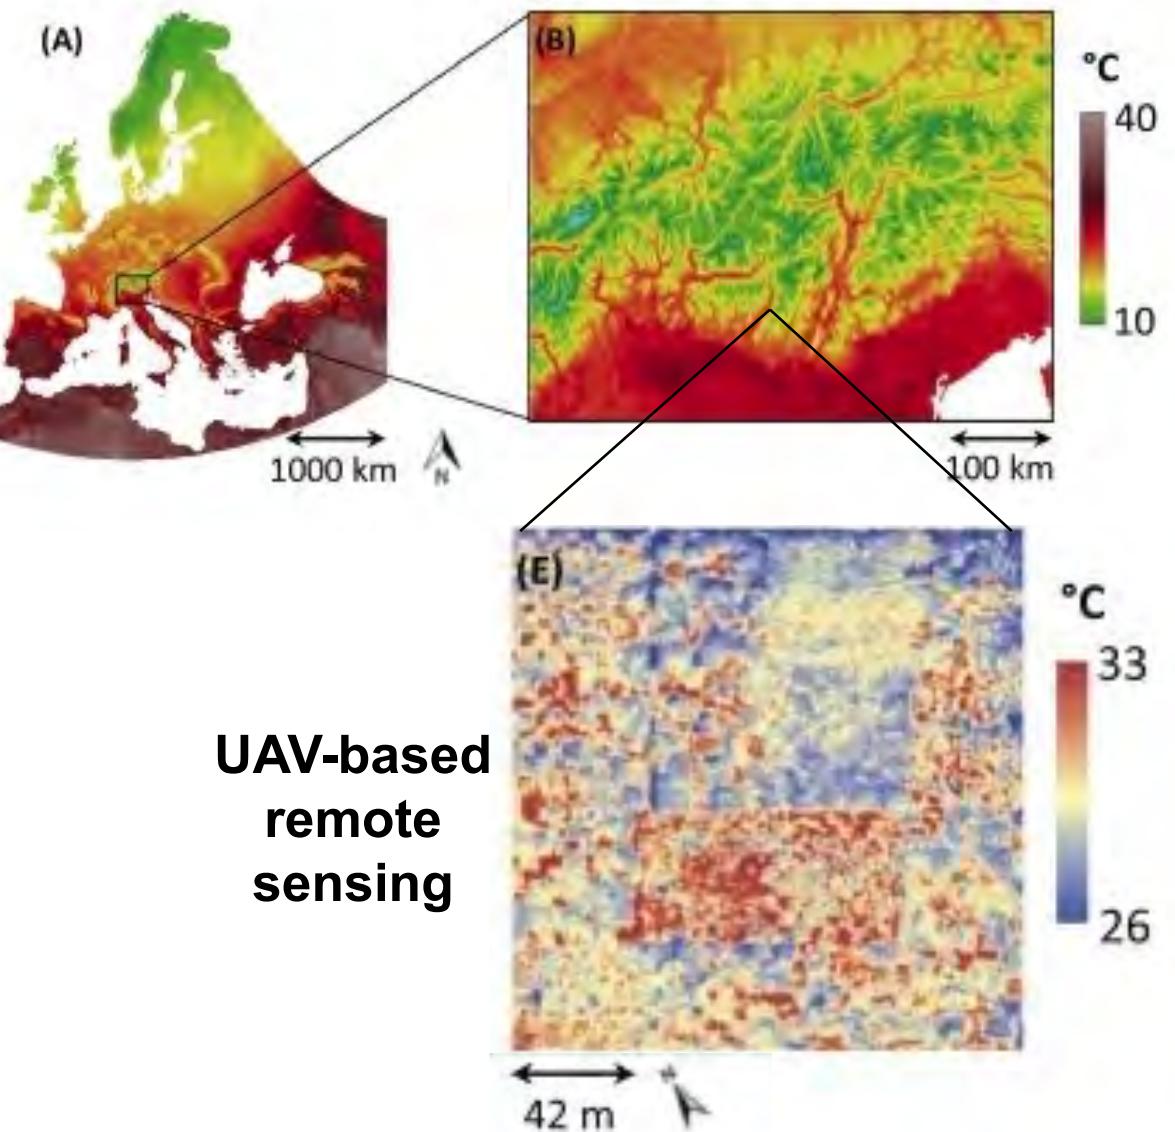

Microclimate matters

Satellite-based land surface temperature

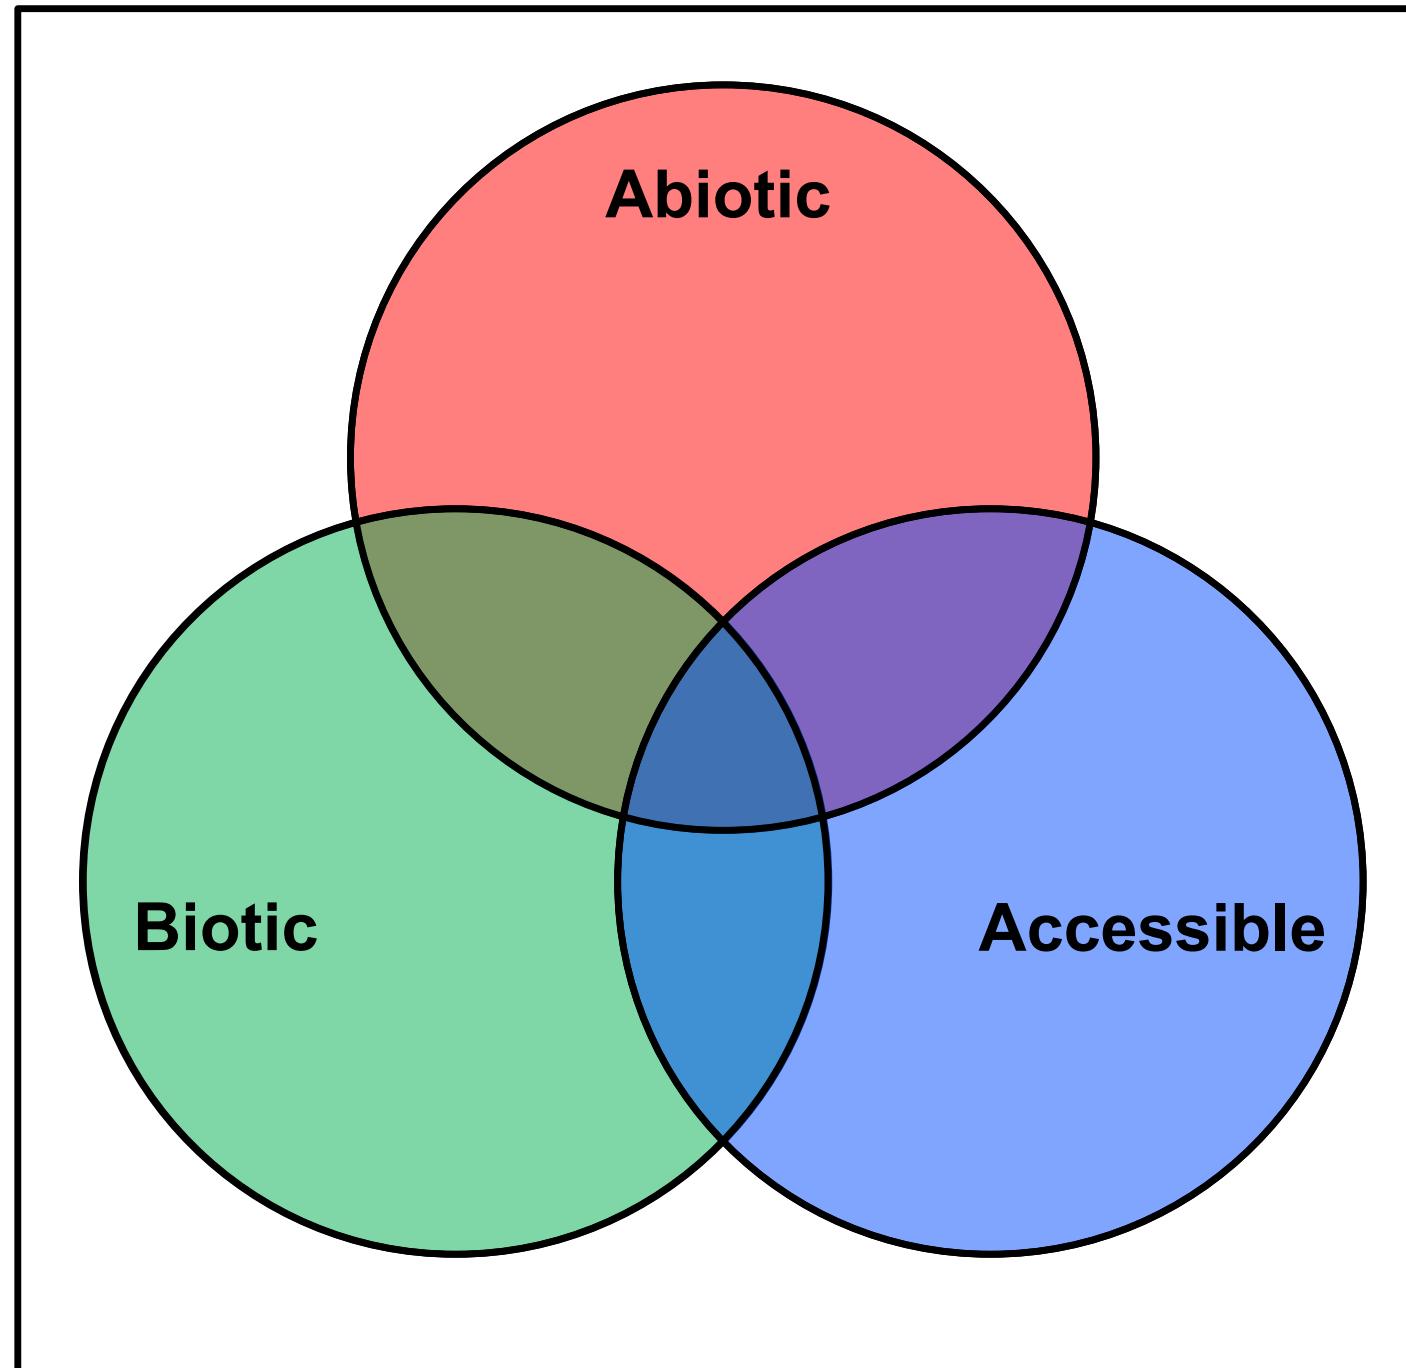

**UAV-based
remote
sensing**

[Zellweger et al. \(2019\) Advances in Microclimate Ecology Arising from Remote Sensing. Trends in Ecology & Evolution 34: 327-341.](#)

Who is where? *And why?*

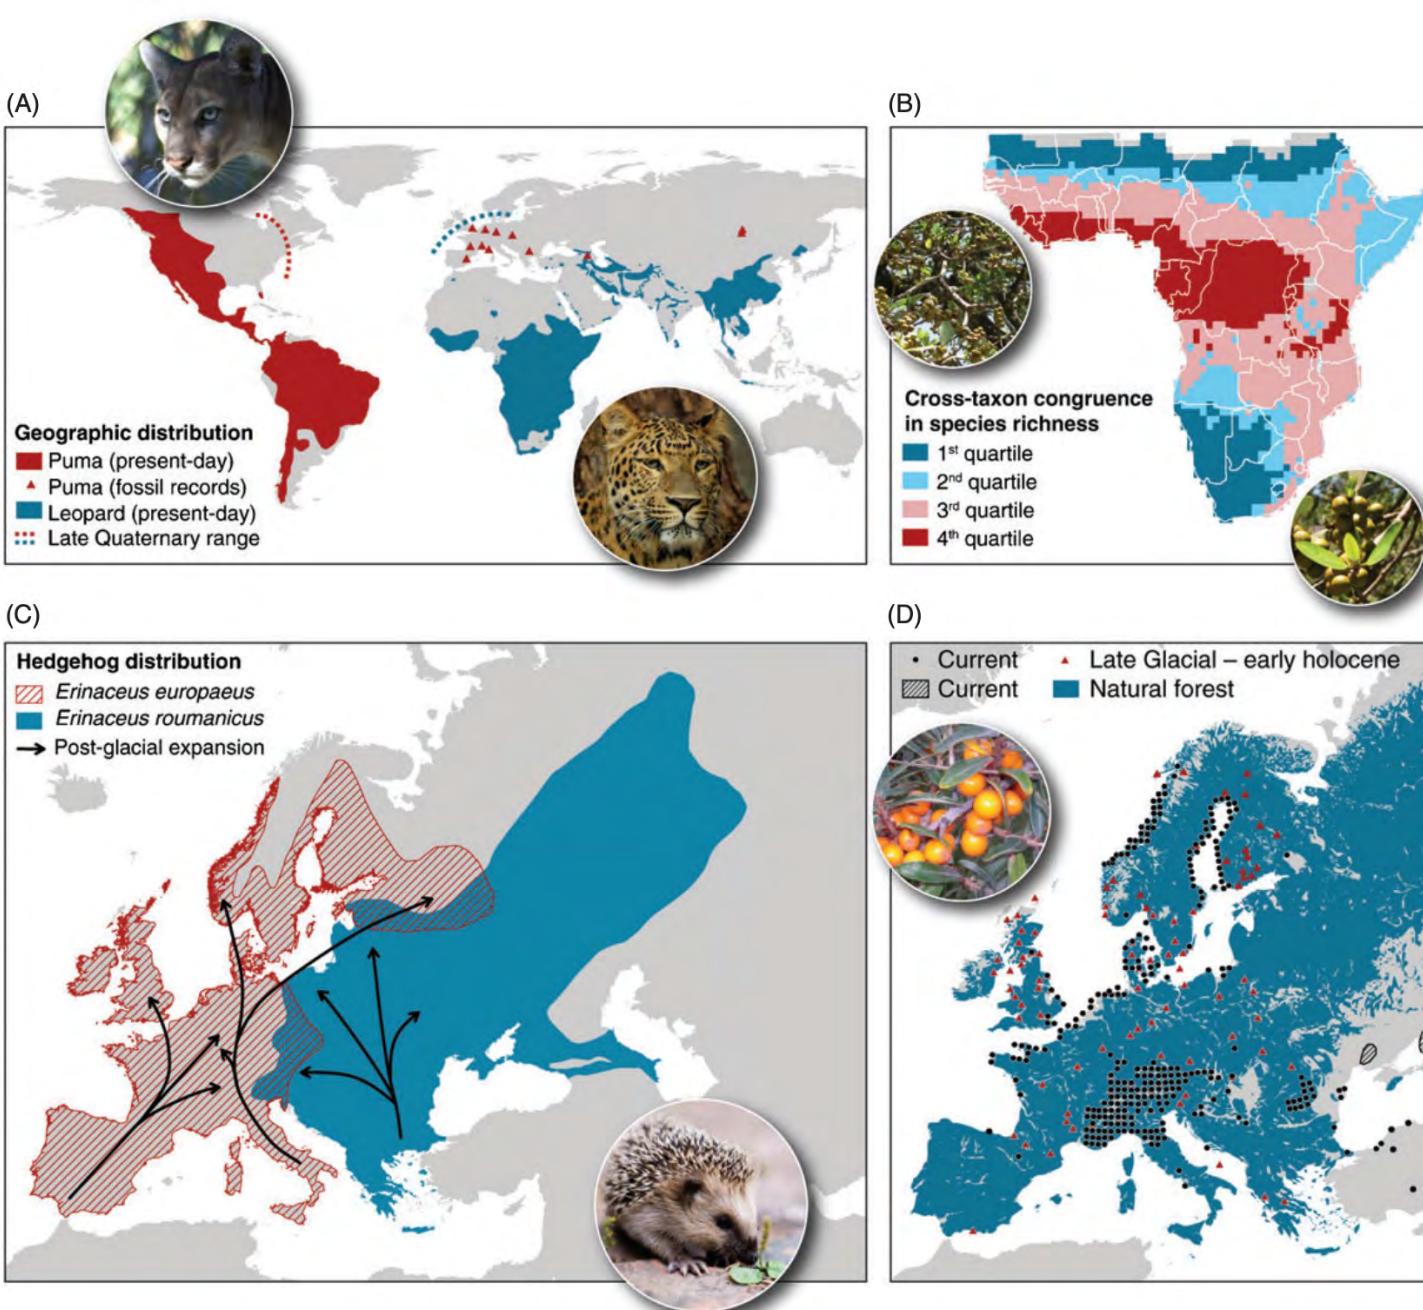

- Accessible (movement)
- Physiological tolerance (abiotic)
- **Biotic interactions**
 - Competition
 - Predators / Prey
 - Parasites
 - Mutualists
 - Pollinators
 - Soil symbionts
 - Facilitators
 - Dispersal

Who is where? And why?

- Accessible (movement)
- Physiological tolerance (abiotic)
- Biotic interactions

Biotic interactions can affect distributions

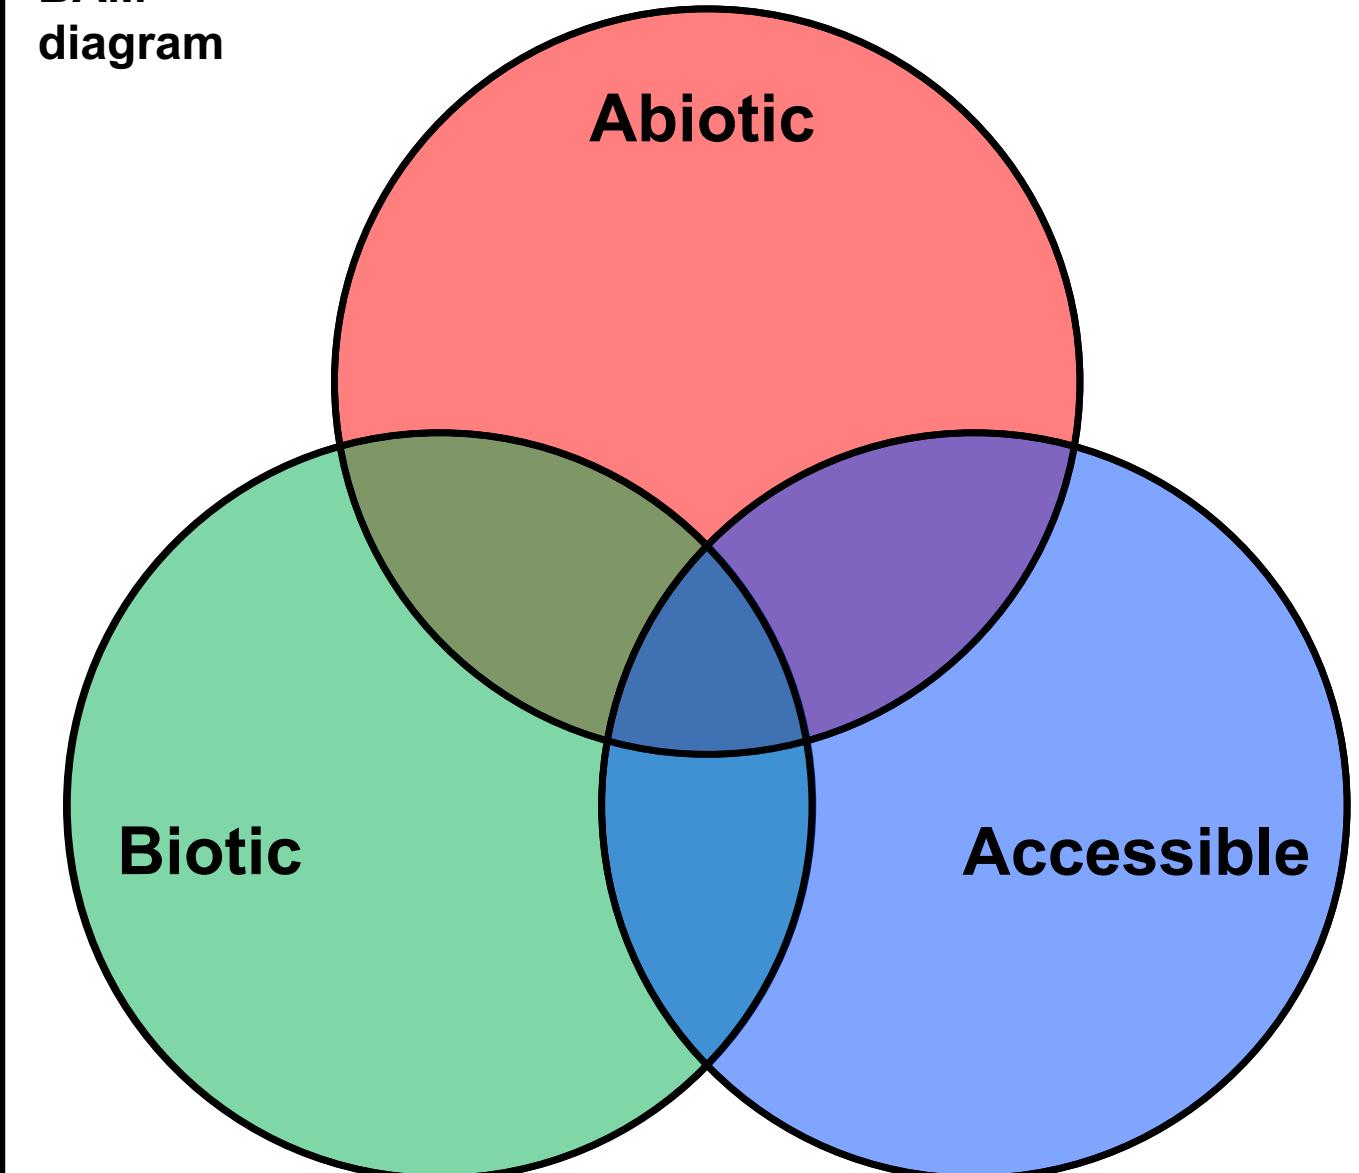

Wisz et al. (2013) The role of biotic interactions in shaping distributions and realised assemblages of species: implications for species distribution modelling. Biological Reviews 88: 15-30.

Who is where? *And why?*

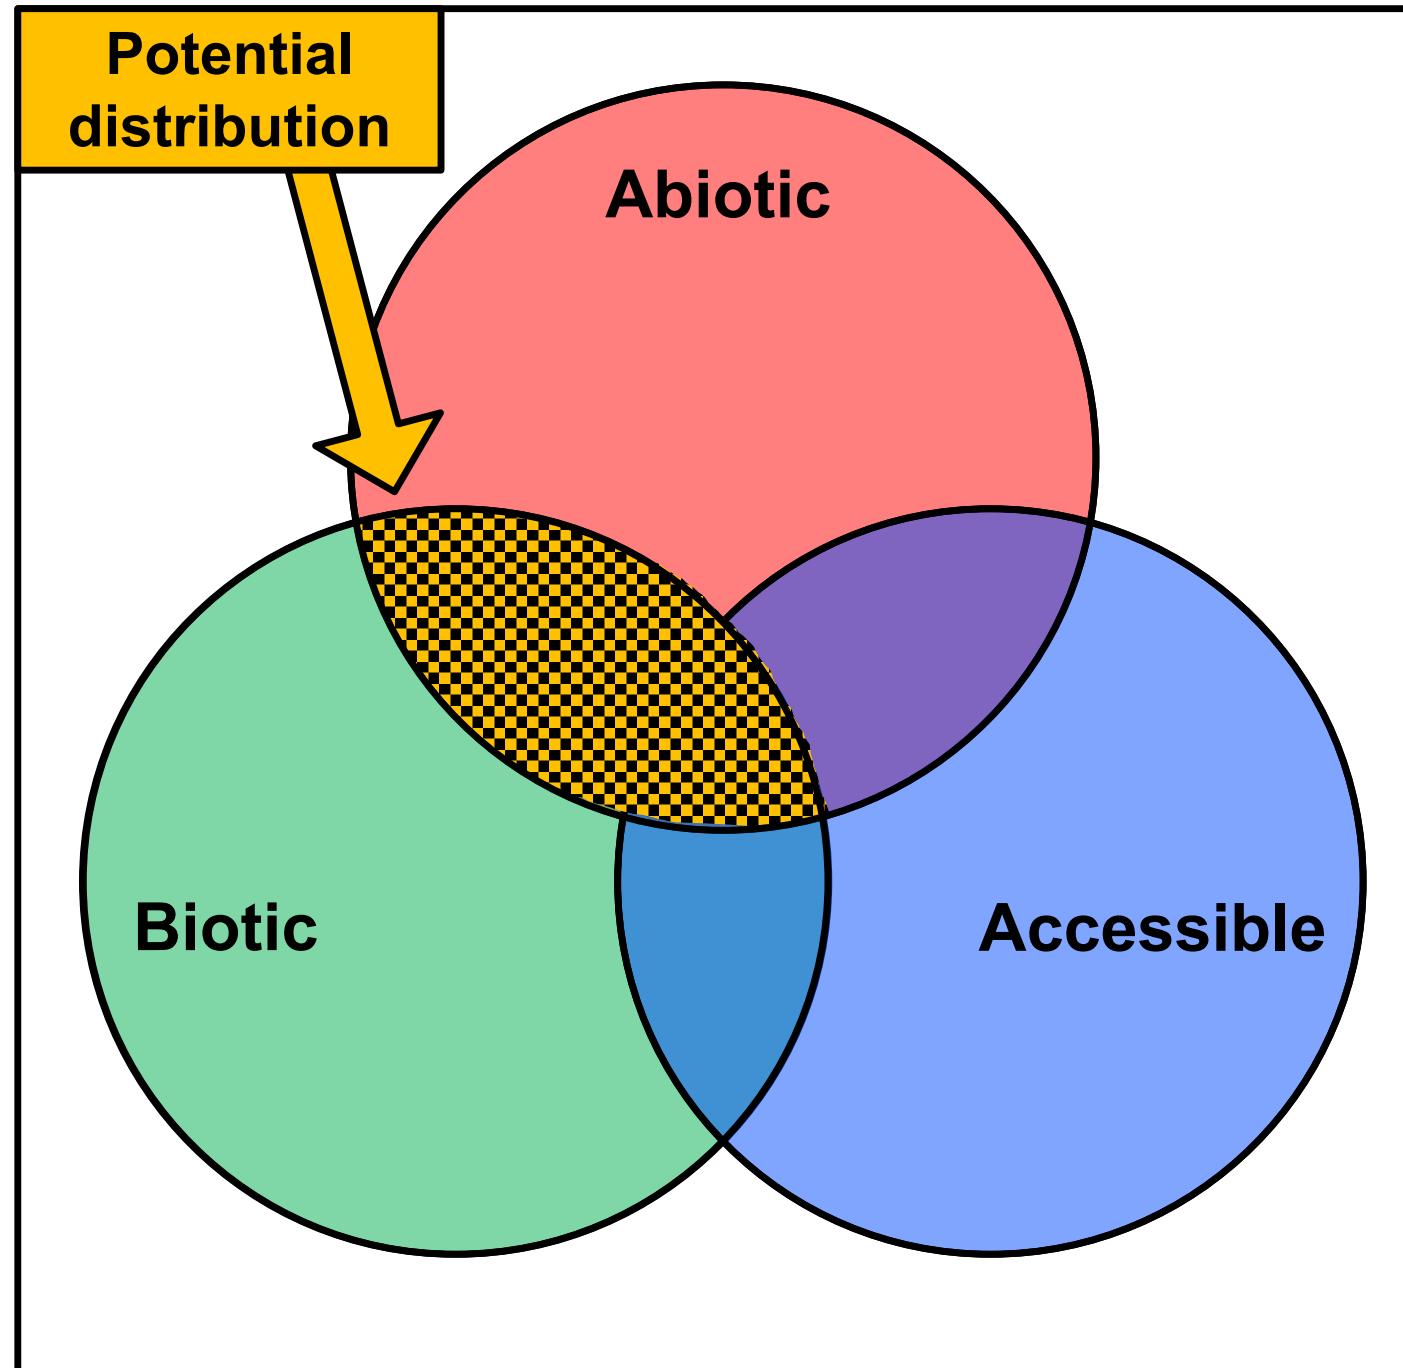

- Accessible (movement)
- Physiological tolerance (abiotic)
- Biotic interactions

BAM
diagram

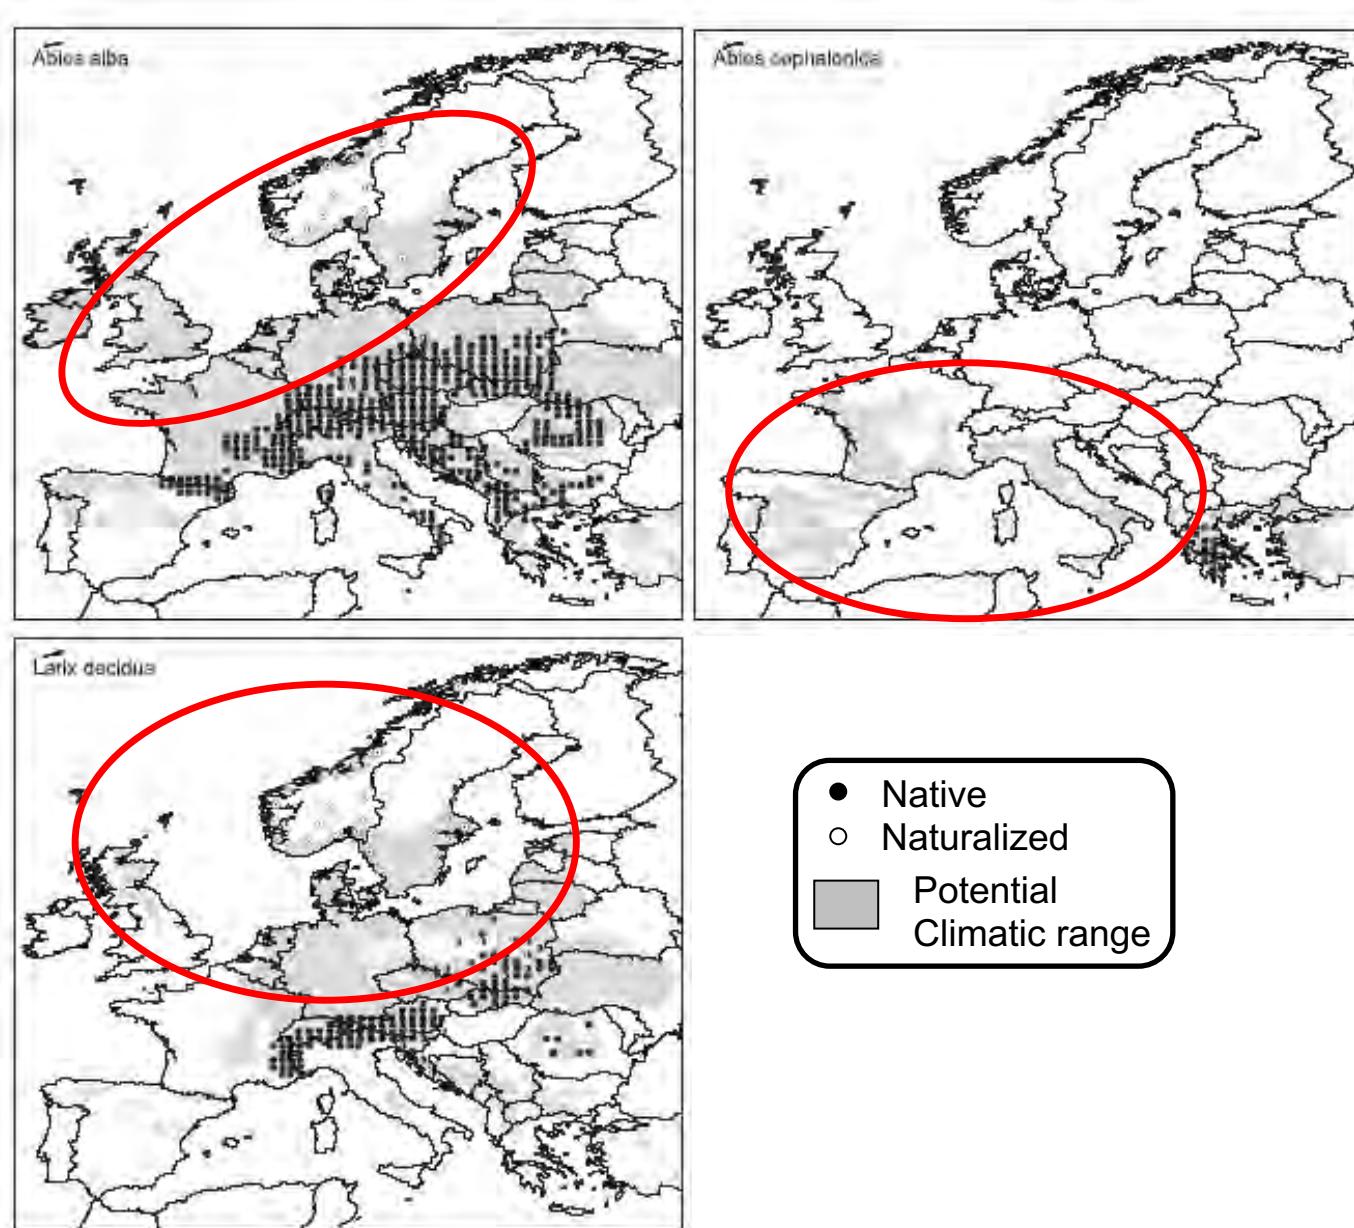

Who is where? *And why?*

- Accessible (movement)
- Physiological tolerance (abiotic)
- Biotic interactions

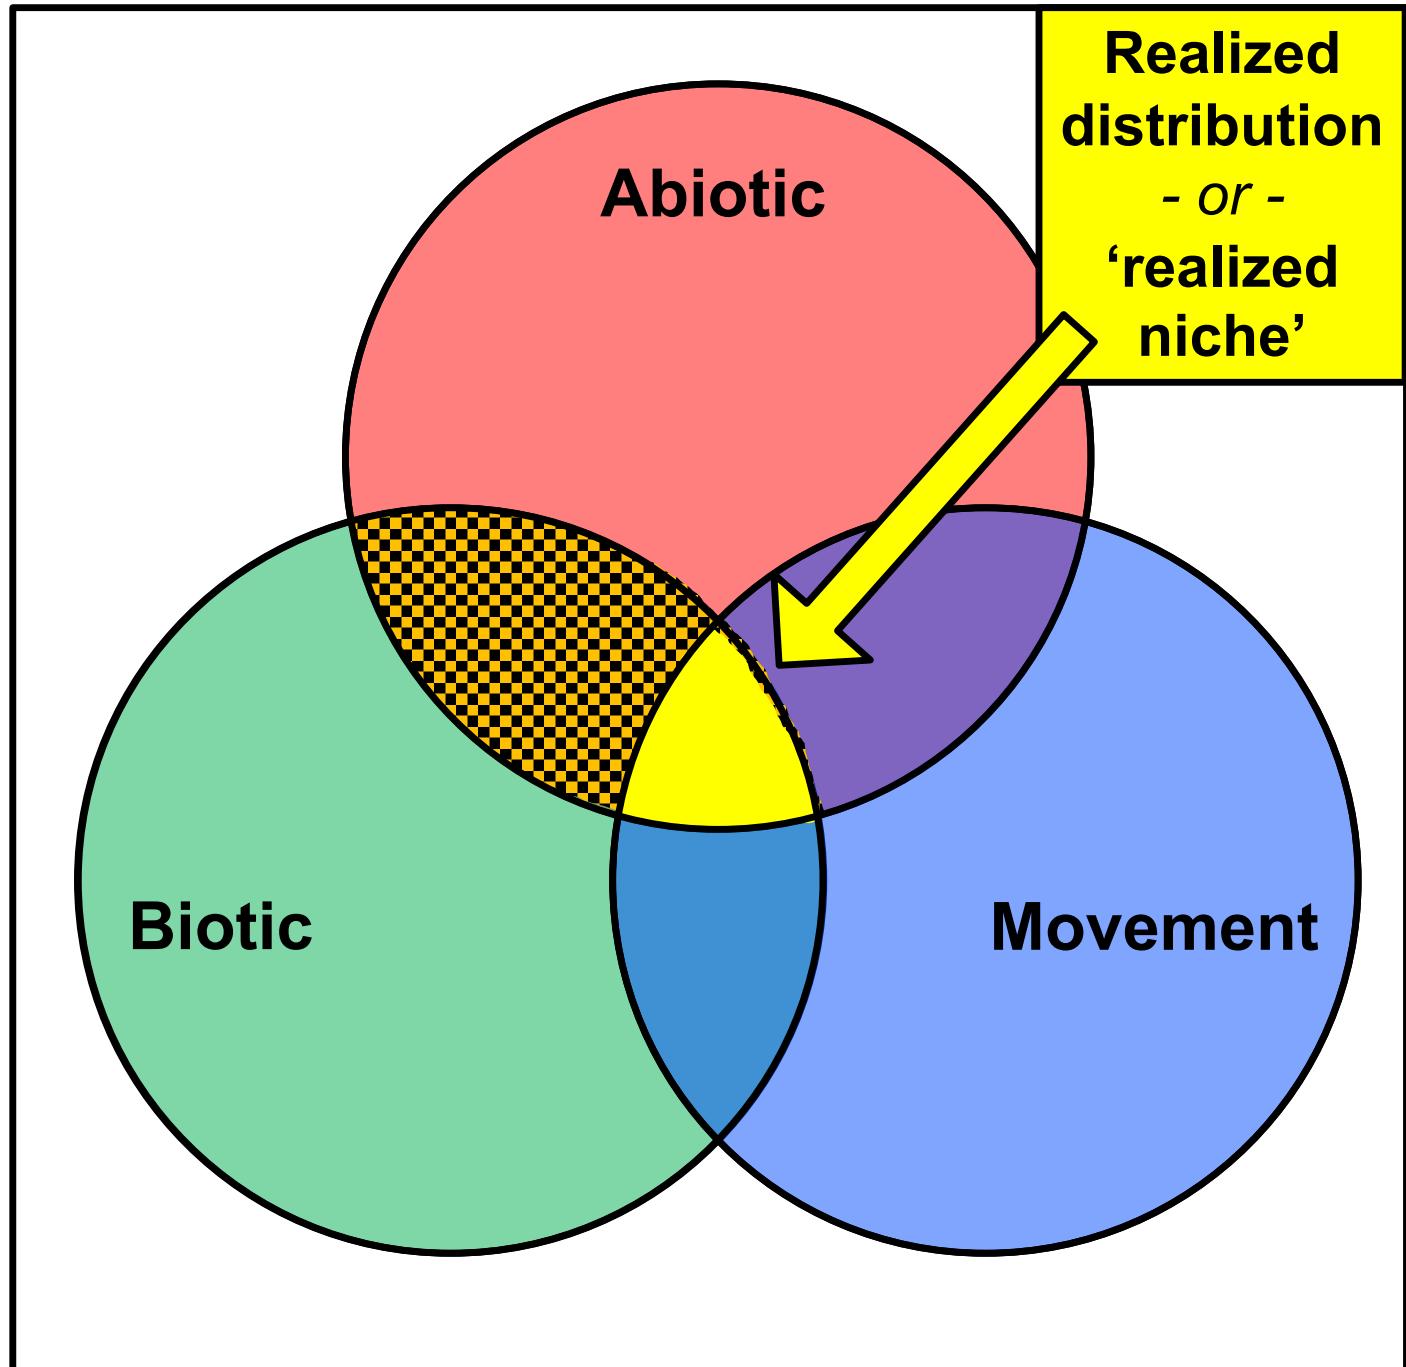

Limited filling of the potential range in European tree species

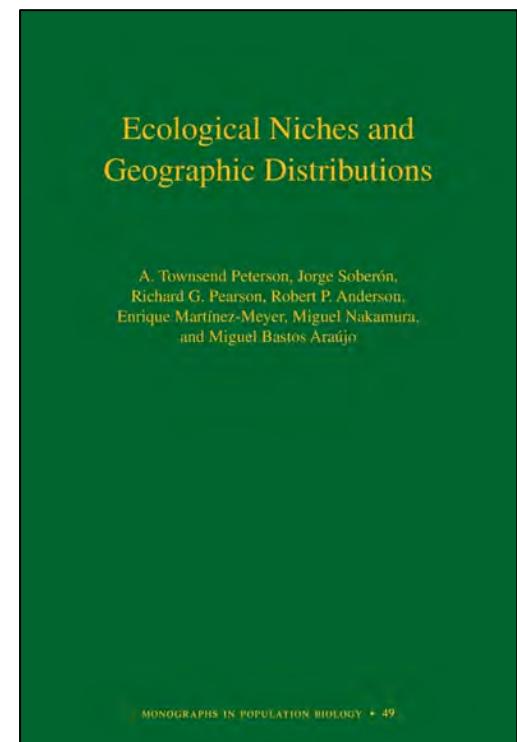

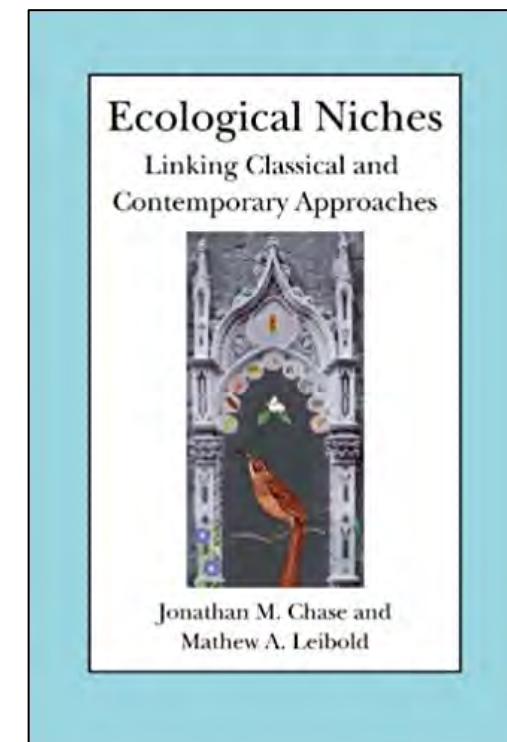

Who is where? *And why?*

- Accessible (movement)
- Physiological tolerance (abiotic)
- Biotic interactions

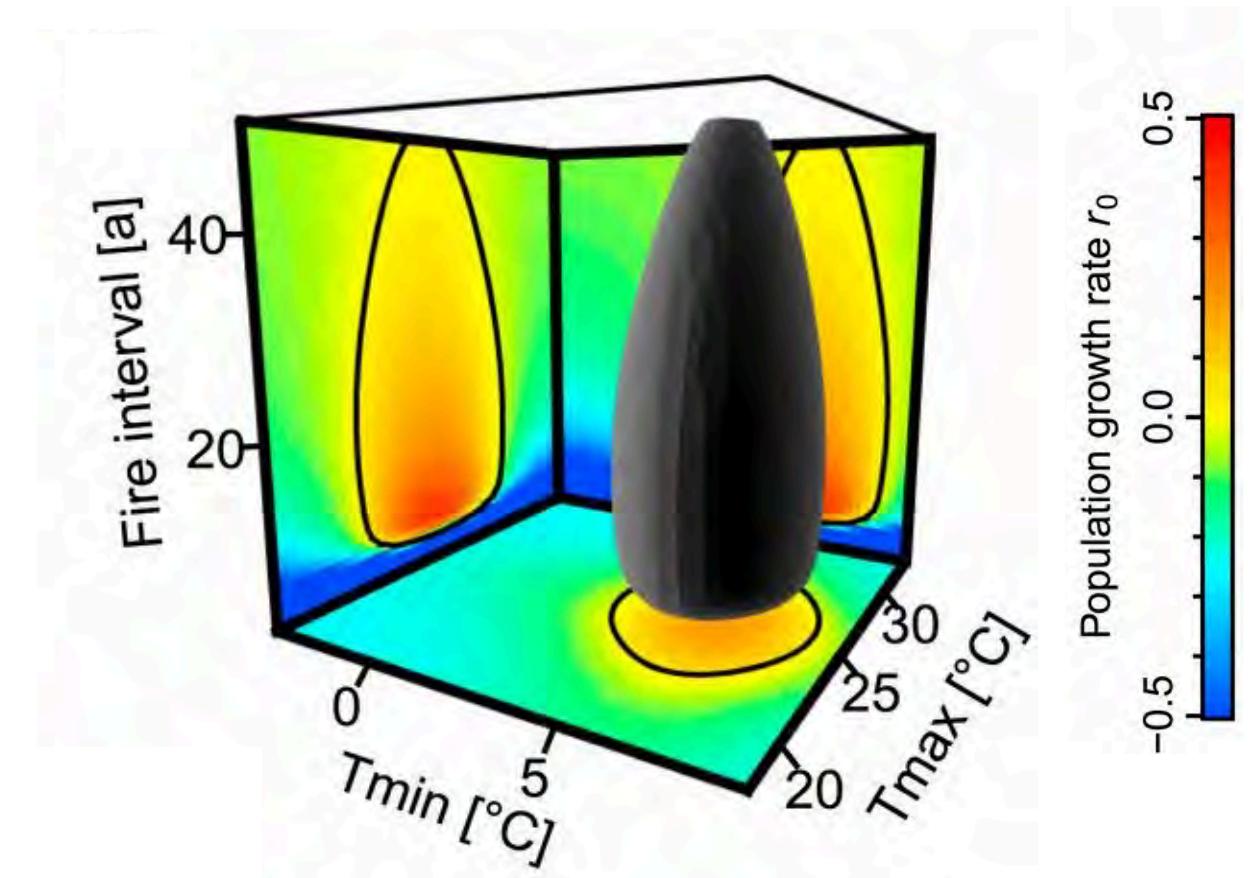

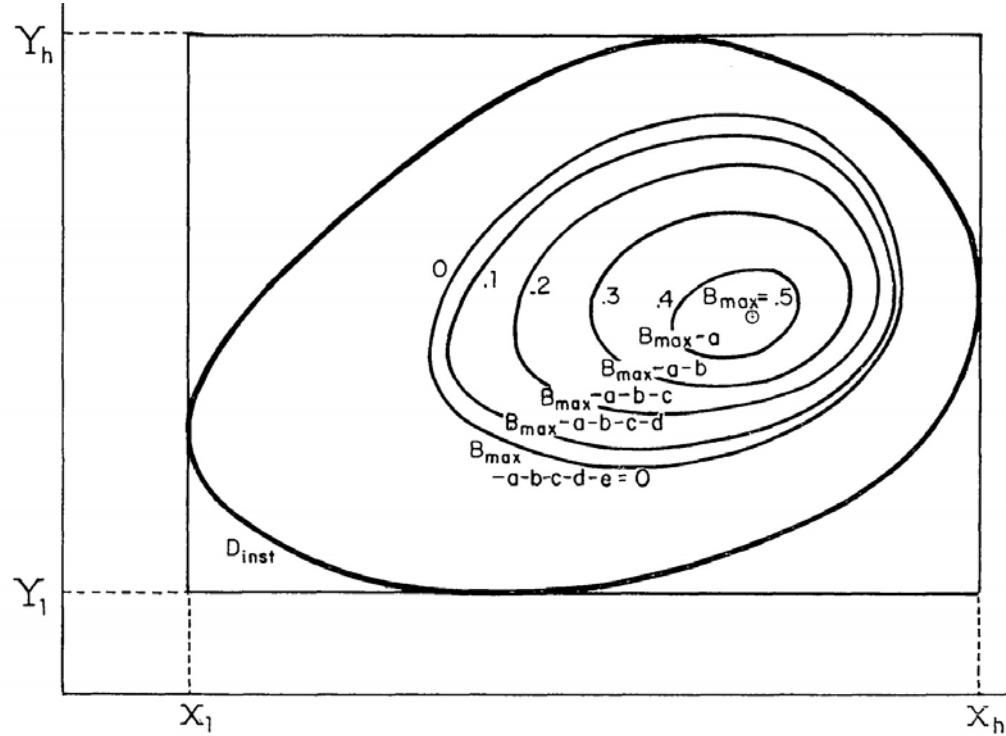

The Ecological Niche

- Broadly defined as the conditions where a species can exist (*spatial, temporal, behavioral, etc.*)
- Multivariate and complex, (e.g., life stages, above / below-ground, etc.)
- The ecological niche is a *scientific construction* – NOT a specific place
- Multiple definitions and hotly debated!

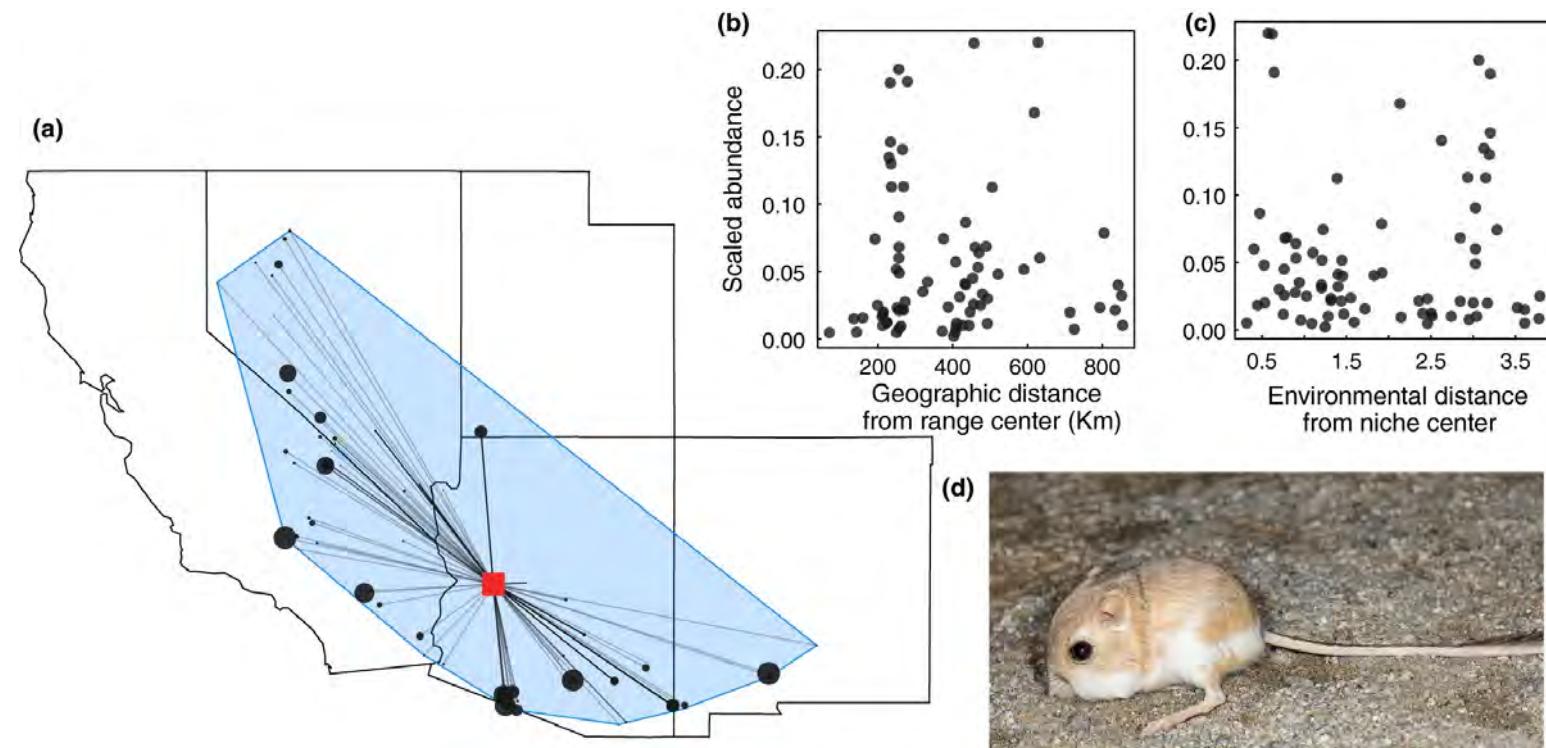

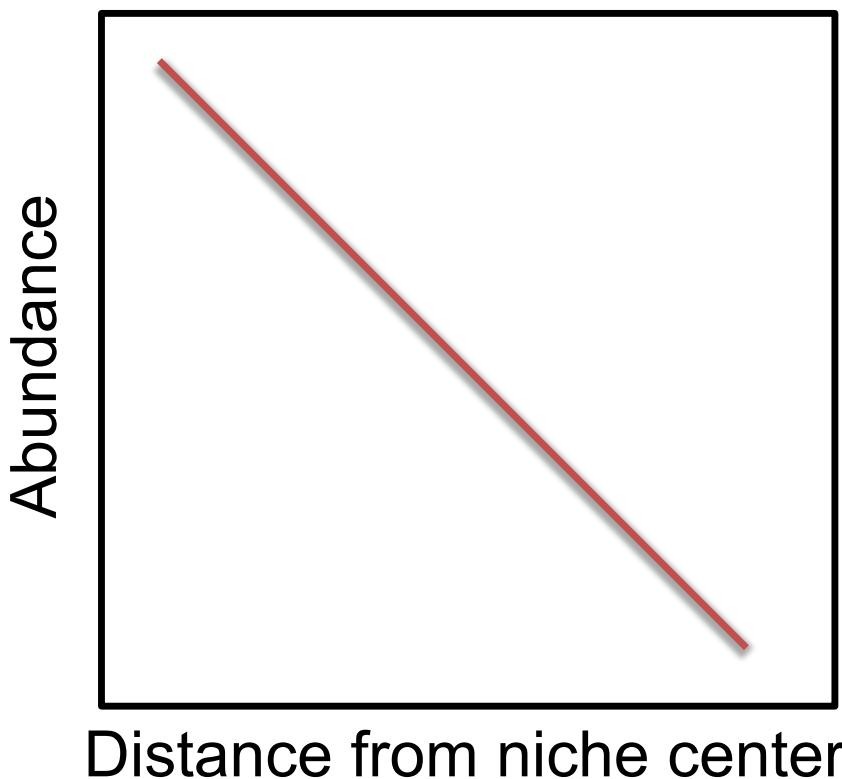

The Ecological Niche as a *fitness landscape*

- Maguire (1973) proposed niches should have a structure measured in fitness

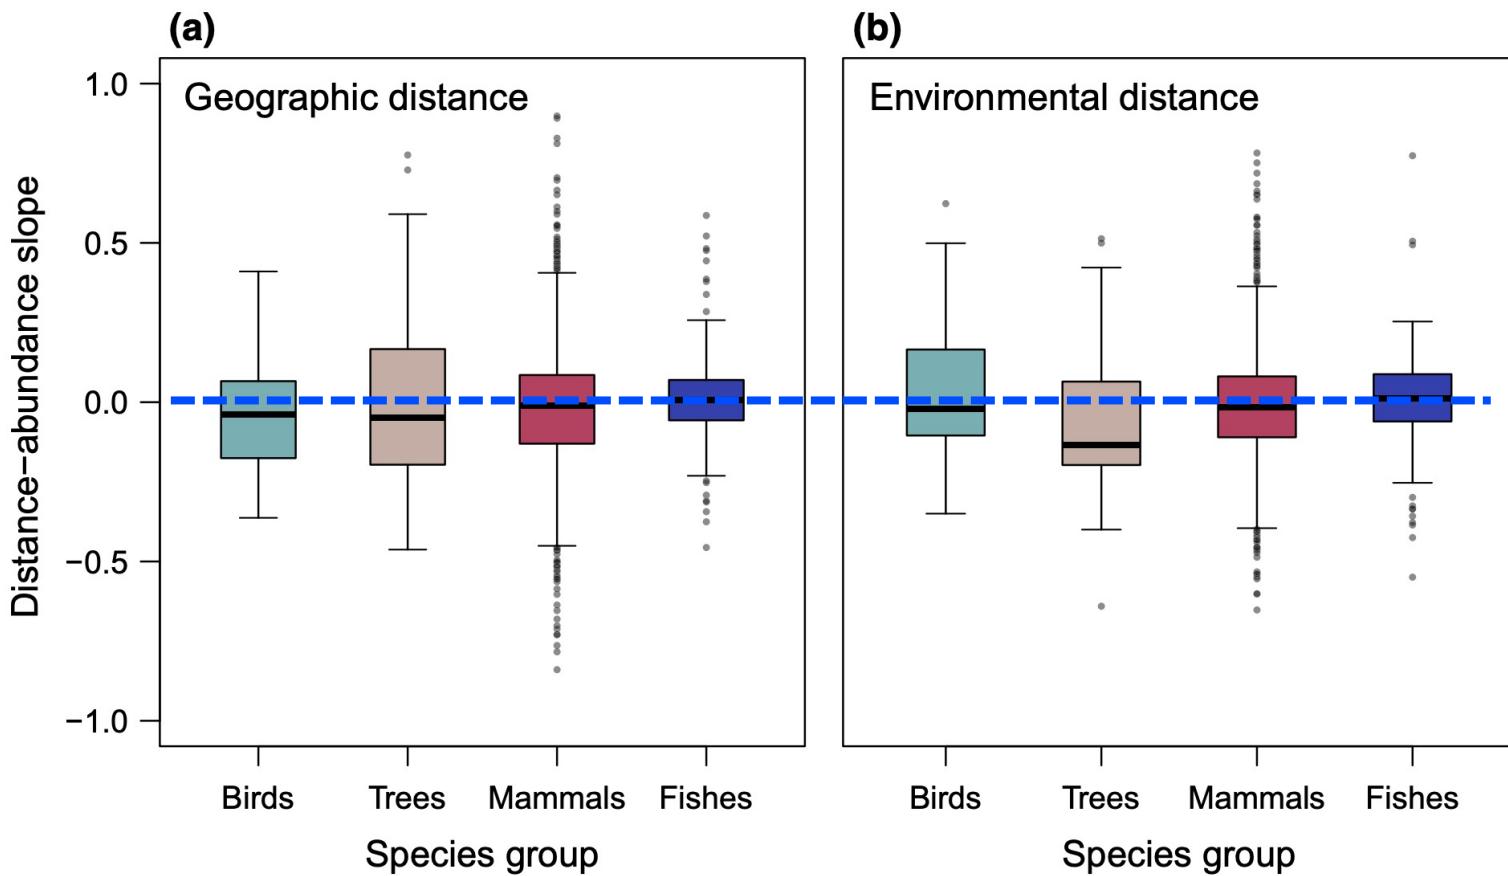

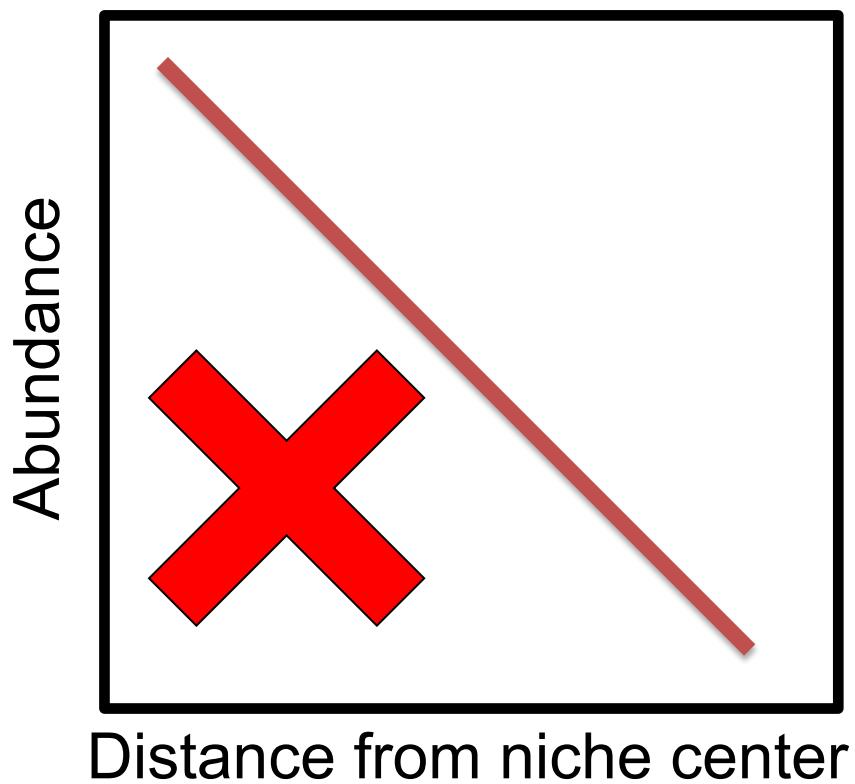

The ‘Abundant Center’ Hypothesis

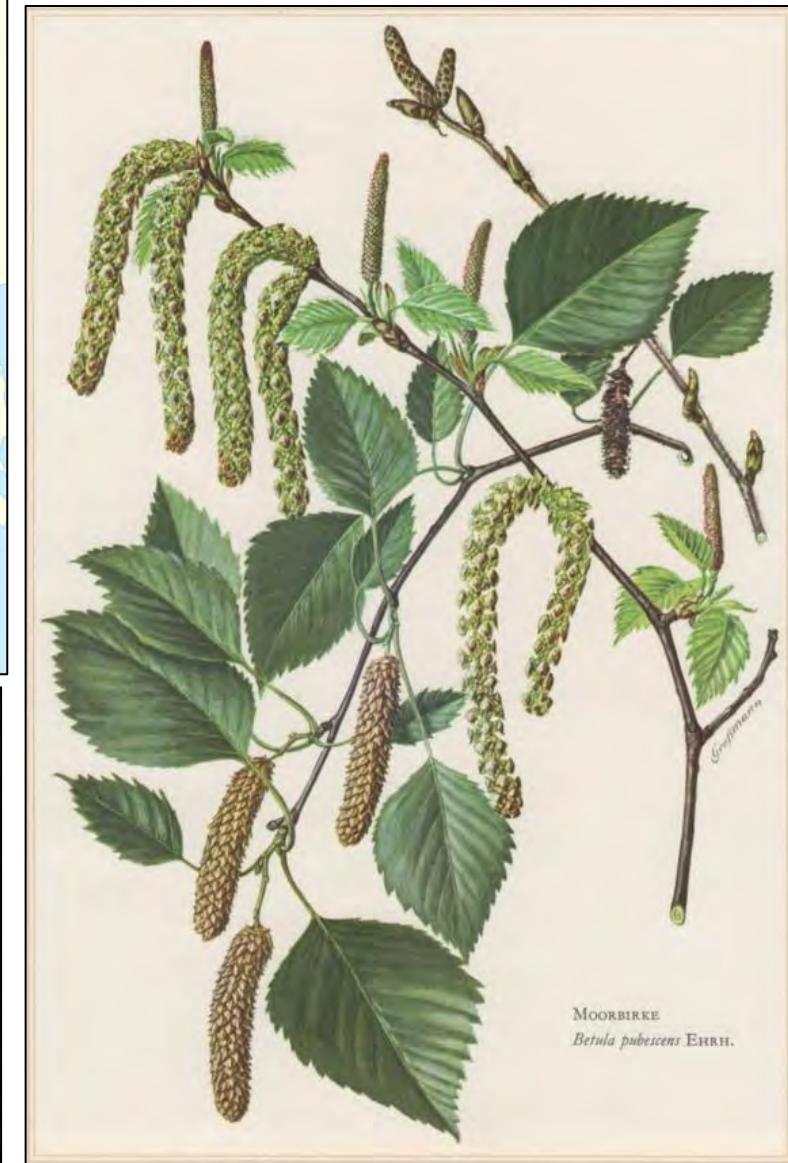

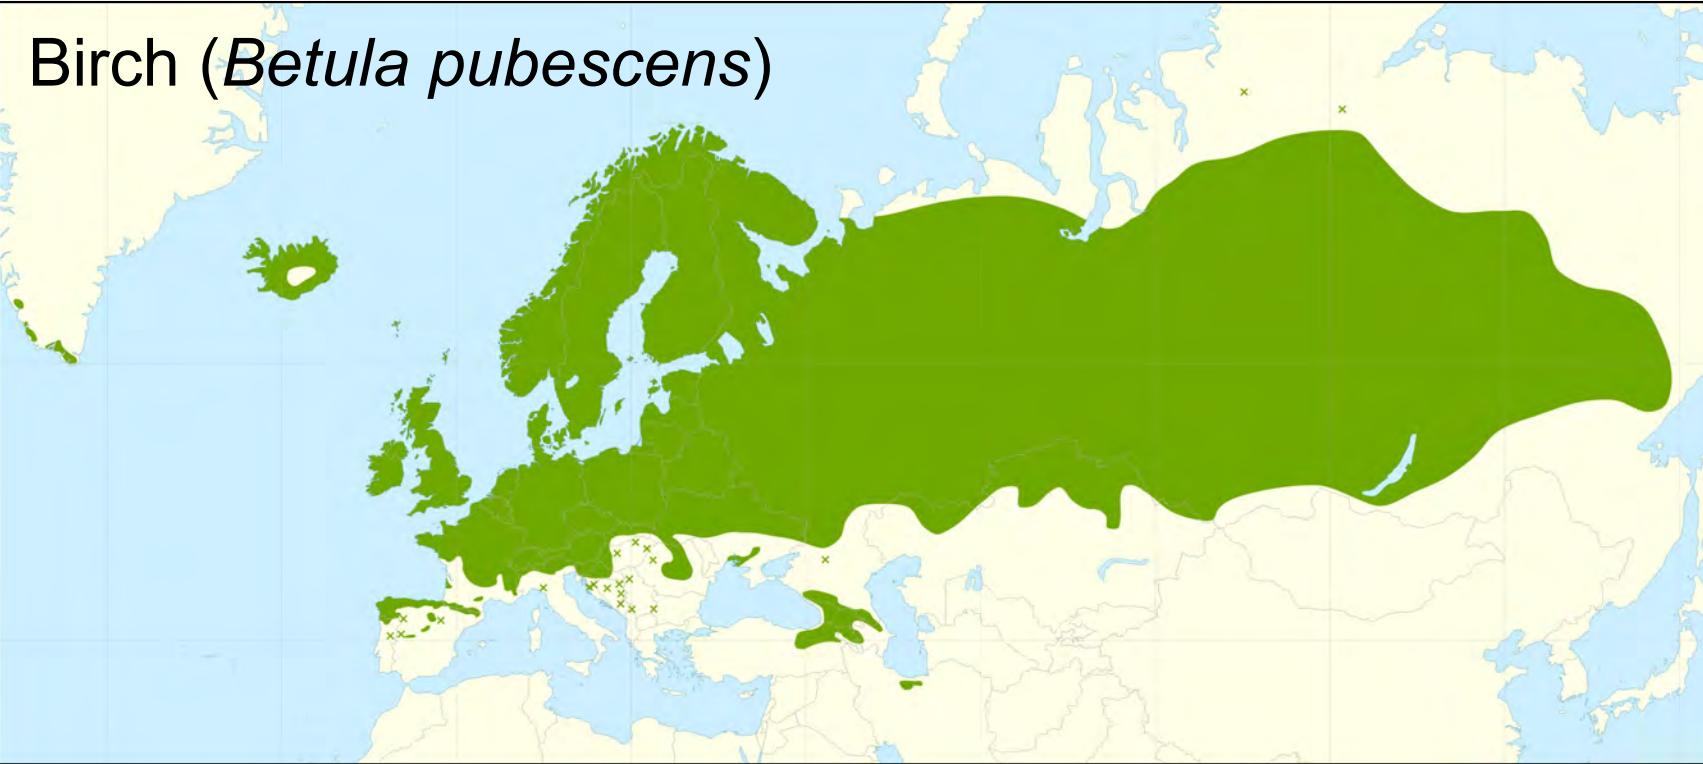

For >1,400 species of birds, trees, mammals, fishes:

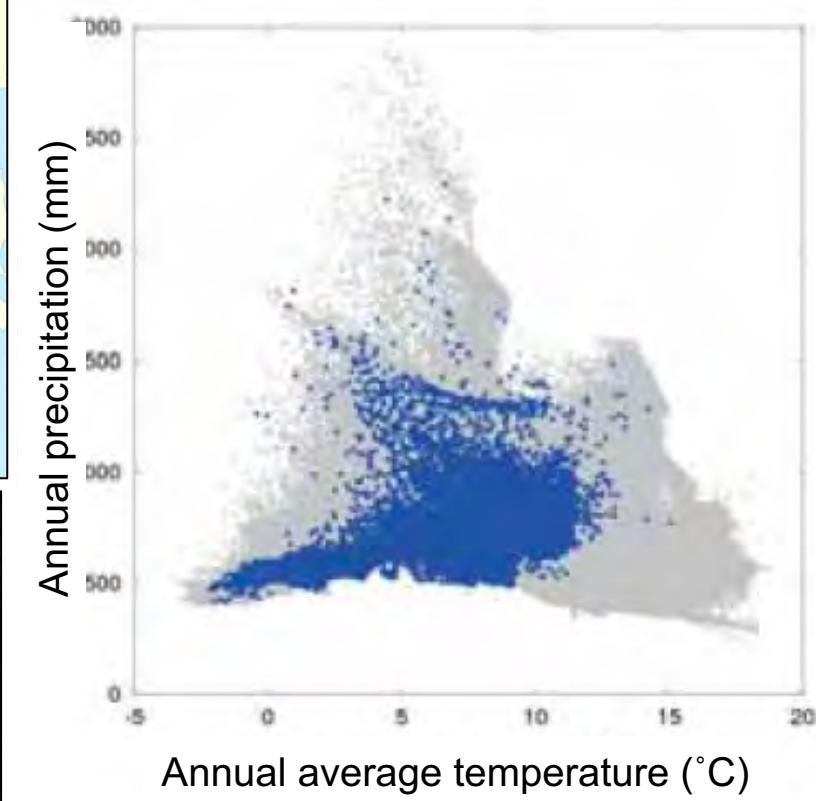

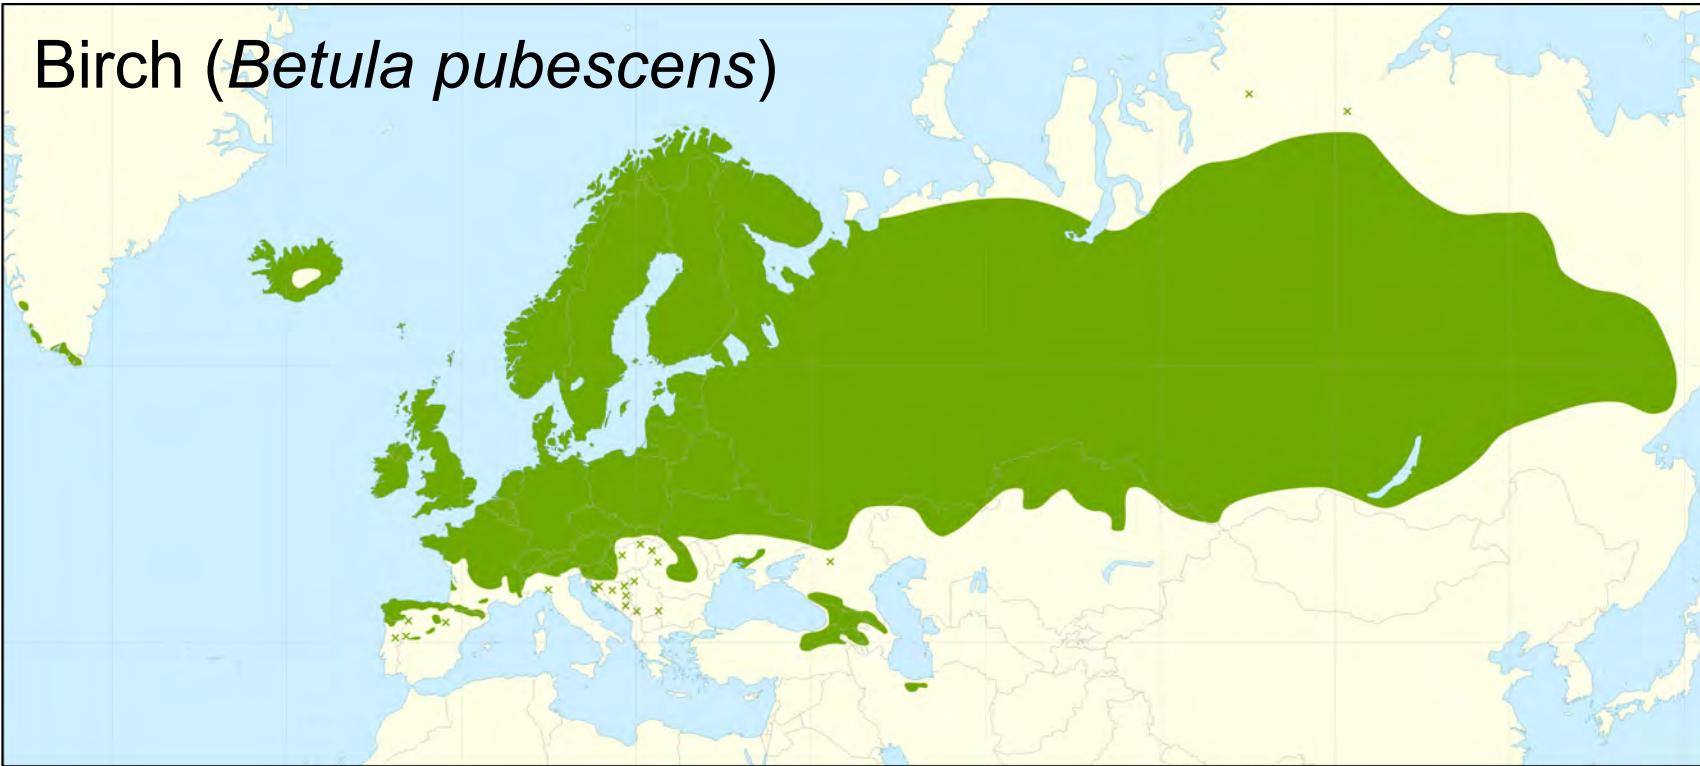

The ‘Abundant Center’ Hypothesis

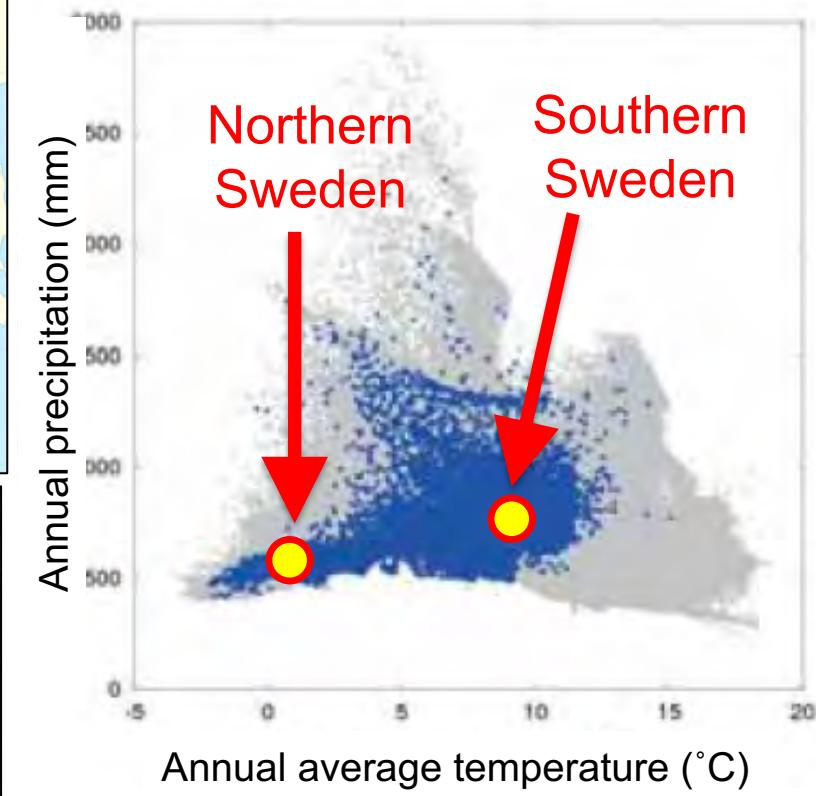

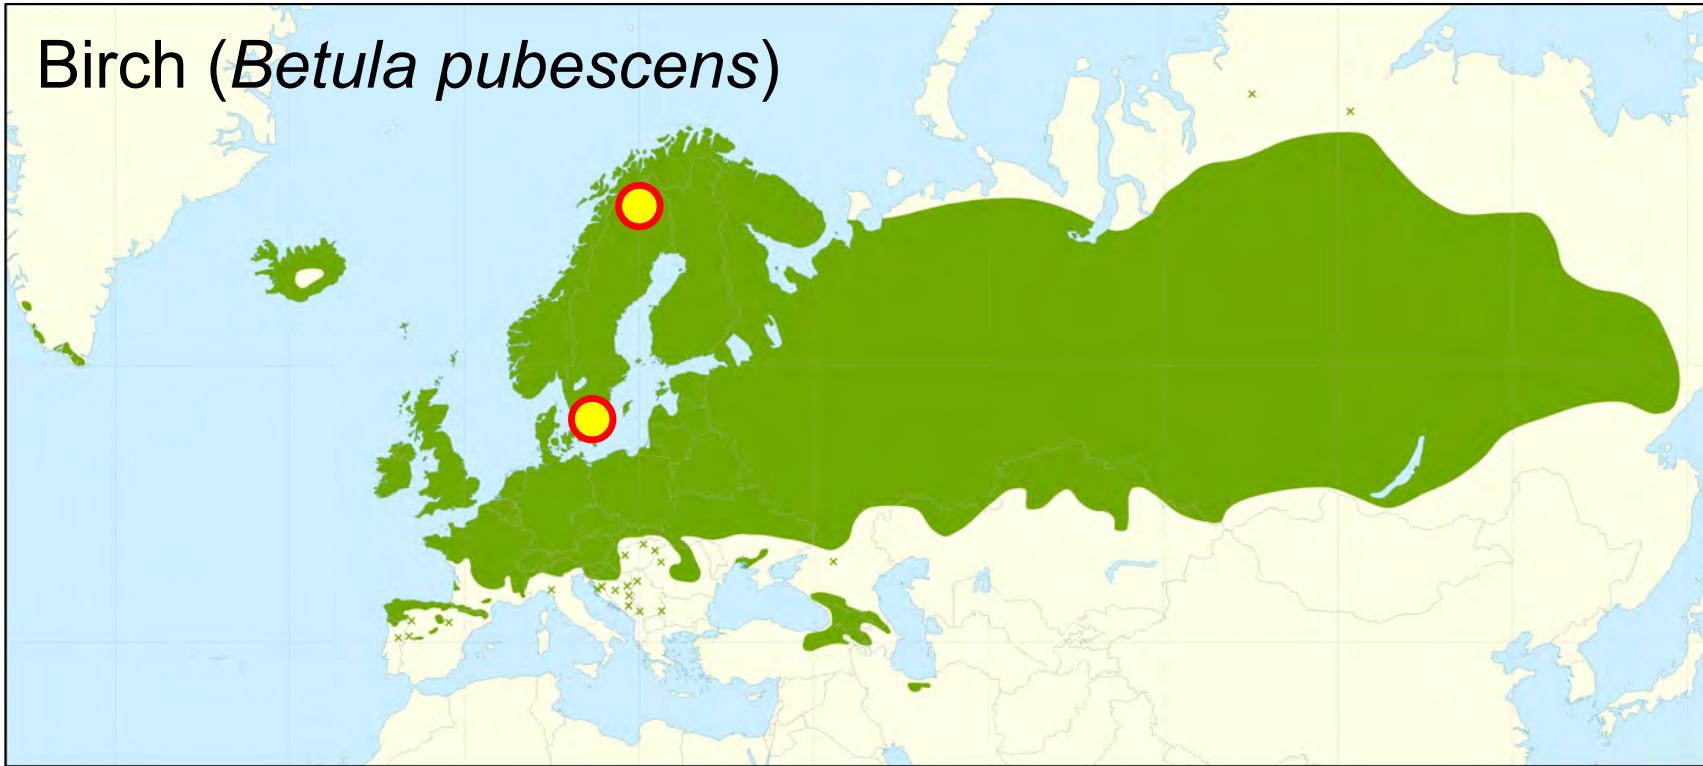

Birch (*Betula pubescens*)

Birch (*Betula pubescens*)

Birch (*Betula pubescens*)

Intraspecific variation and ecotypes

Turesson's birches

Göte Turesson
(1892 – 1970)

Dag Hammarskjölds Väg, across from SLU

Lappland
(Northern Sweden)

Scania
(Southern Sweden)

Summary

- Species distributions + niches are scale-dependent and estimated from imperfect data
- Species distributions + niches are governed by a combination of accessibility, abiotic conditions, and biotic interactions
- Species distributions + niches are dynamic and change in space / time
- Abundance + fitness vary in complex ways across a species' distribution + niche

Questions?

Henri Rousseau, *The Hungry Lion Throws Itself on the Antelope*, 1905

Henri Rousseau

Small group discussions of pre-course readings

- *What did you find most interesting / confusing?*
- *What seems to be the most challenging aspect of building species distribution model?*
